

## INTERNATIONAL SEARCH REPORT

International Application No  
PCT/GB2005/000223A. CLASSIFICATION OF SUBJECT MATTER  
IPC 7 A61M5/20 A61M5/30

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)  
IPC 7 A61M

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, WPI Data

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
Y	US 6 544 234 B1 (GABRIEL JOCHEN) 8 April 2003 (2003-04-08) column 2, line 24 - column 5, line 65; figures 1-19	1-32
Y	WO 03/097133 A (OWEN MUMFORD LIMITED; MARSHALL, JEREMY) 27 November 2003 (2003-11-27) page 4, line 5 - page 7, line 7; figures 1-5	1-32
A	US 5 681 291 A (GALLI ET AL) 28 October 1997 (1997-10-28) column 5, line 4 - column 9, line 52; figures 1-13	1-32 -/-

 Further documents are listed in the continuation of box C. Patent family members are listed in annex.

## \* Special categories of cited documents :

- "A" document defining the general state of the art which is not considered to be of particular relevance
- "E" earlier document but published on or after the international filing date
- "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- "O" document referring to an oral disclosure, use, exhibition or other means
- "P" document published prior to the international filing date but later than the priority date claimed

- "T" later document published after the International filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

- "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

- "Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

- "&" document member of the same patent family

**Decision to grant a European patent pursuant to article 97(2) EPC**

Following examination of European patent application No. 05701985.3 a European patent with the title and the supporting documents indicated in the communication pursuant to Rule 51(4) EPC dated 30.04.07 is hereby granted in respect of the designated Contracting States.

Patent No. : 1715903  
Date of filing : 24.01.05  
Priority claimed : 23.01.04/GBA 0401469  
27.01.04/CAA 2455937  
28.01.04/USA 767860

## ANMERKUNG ZUR ENTSCHEIDUNG ÜBER DIE ERTEILUNG EINES EUROPÄISCHEN PATENTS (EPA Form 2006)

- 1. EPA Informationsbroschüre "Nationales Recht zum EPÜ"**  
Diese Broschüre enthält nützliche Informationen zu den formalen Erfordernissen und den Handlungen, die vor den Patentbehörden der Vertragsstaaten vorzunehmen sind, um Rechte in diesen Staaten zu erlangen. Da diese Handlungen einem ständigen Wandel unterworfen sind, sollte immer nur die neueste Ausgabe der Broschüre benutzt werden. Nachträgliche Informationen werden im Amtsblatt veröffentlicht.
- 2. Übersetzung der europäischen Patentschrift nach Artikel 65(1) des Europäischen Patentübereinkommens**  
Sie werden erneut darauf hingewiesen, dass bestimmte Vertragsstaaten nach Artikel 65(1) EPÜ eine Übersetzung der europäischen Patentschrift verlangen; hierauf wird in der Mitteilung gemäss Regel 51(6) verwiesen. Die Nichteinreichung dieser Übersetzung kann zur Folge haben, dass das Patent in dem betreffenden Staat/in den betreffenden Staaten als von Anfang an nicht eingetreten gilt. Weitere Einzelheiten entnehmen Sie bitte der oben genannten Broschüre.
- 3. Zahlung von Jahresgebühren für europäische Patente**  
Nach Artikel 141 EPU können "nationale" Jahresgebühren für das europäische Patent für die Jahre erhoben werden, die an das Jahr anschliessen, in dem der Hinweis auf die Erteilung des europäischen Patents im "Europäischen Patentblatt" bekanntgemacht wird. Weitere Einzelheiten entnehmen Sie bitte der oben genannten Broschüre.

## NOTE RELATING TO THE DECISION TO GRANT A EUROPEAN PATENT (EPO Form 2006)

- 1. EPO Information Brochure "National law relating to the EPC".**  
This brochure provides useful information regarding formal requirements and the steps to be taken before the patent authorities of the Contracting States in order to acquire rights in those states. Since the necessary steps are subject to change the latest edition of the brochure should always be used. Subsequent information is published in the Official Journal.
- 2. Translation of the European patent specification under Article 65(1) of the European Patent Convention**  
Your attention is again drawn to the requirements regarding translation of the European patent specification laid down by a number of Contracting States under Article 65(1) EPC, to which reference is made in the communication under Rule 51(6). Failure to supply such translation(s) may result in the patent being deemed to be void "ab initio" in the State(s) in question. For further details you are recommended to consult the above-mentioned brochure.
- 3. Payment of renewal fees for European patents**  
Under Article 141 EPC 'national' renewal fees in respect of a European patent may be imposed for the years which follow that in which the mention of the grant of the European patent is published in the "European Patent Bulletin". For further details you are recommended to consult the above-mentioned brochure.

## REMARQUE RELATIVE A LA DECISION DE DELIVRANCE D'UN BREVET EUROPEEN (OEB Form 2006)

- 1. Brochure d'information de l'OEB "Droit national relatif à la CBE"**  
Cette brochure fournit d'utiles renseignements sur les conditions de forme requises et sur les actes à accomplir auprès des offices de brevet des Etats contractants aux fins d'obtenir des droits dans les Etats contractants. Etant donné que les actes indispensables sont susceptibles de modifications, il serait bon de toujours consulter la dernière édition de la brochure. Toute information ultérieure est publiée au Journal Officiel.
- 2. Traduction du fascicule du brevet européen en vertu de l'article 65(1) de la Convention sur le brevet européen**  
Votre attention est de nouveau attirée sur l'obligation faite par certains Etats contractants, en vertu de l'article 65(1) CBE, de fournir une traduction du fascicule du brevet européen, à laquelle il est fait référence dans la notification établie conformément à la règle 51(6). Si la(les) traduction(s) n'est(ne sont) pas fournie(s), le brevet européen peut, dès l'origine, être réputé sans effet dans cet(ces) Etat(s). Pour plus de détails, nous vous renvoyons à la brochure susmentionnée.
- 3. Paiement des taxes annuelles pour le brevet européen**  
Conformément à l'article 141 CBE, les taxes annuelles "nationales" dues au titre du brevet européen peuvent être perçues pour les années suivant celle au cours de laquelle la mention de la délivrance du brevet européen est publiée au "Bulletin européen des brevets". Pour plus de détails, nous vous renvoyons à la brochure susmentionnée.

Dear Sirs

**European Patent Application No 05701985.3**  
**Auto Safety Injector**  
**The Medical House plc**

This letter and enclosures are in response to the Communication under Rule 51(4) EPC dated 30 April 2007.

The text accompanying the above communication is hereby approved. Enclosed herewith are translations of the agreed claims into French and German, together with a fee voucher in respect of the fees for grant and printing of the European patent.

The relevant fees should be debited from our deposit account number 28050228. The EPO is hereby authorised to debit or credit any under or over payment in the fees specified in the attached fee voucher to the above referenced deposit account.

The applicant also requests that you provide a paper copy of the specification together with the certificate for the European patent.

Please return EPO Form 1037, enclosed herewith, as confirmation of receipt.

Yours faithfully

A handwritten signature in black ink, appearing to read 'Michael J Ajeilo'.

1  
REVENDICATIONS

1 - Dispositif d'injection comprenant un boîtier externe (30) apte à recevoir :

- un cylindre pour contenir un volume d'un médicament ;
- une aiguille (10) à l'une des extrémités du cylindre, l'aiguille et le cylindre étant tels qu'au moins une partie de l'aiguille est axialement déplaçable dans et hors dudit boîtier externe (30) mais est sollicitée pour être normalement entièrement à l'intérieur dudit boîtier ; et
- un piston (8), déplaçable axialement à l'intérieur du cylindre,

15 le dispositif d'injection comprenant en outre :

- un boîtier interne (7) dans une position intermédiaire entre le boîtier externe et les cylindre et piston ; et
- une source d'énergie (1; 40) en communication avec ledit boîtier interne (7),

20 le dispositif étant déplaçable entre deux positions, à savoir :

- une première position dans laquelle le dispositif agit sur le cylindre de telle sorte qu'en utilisation, les piston et cylindre sont déplaçables axialement de façon à déplacer au moins une partie de ladite aiguille hors du boîtier externe ; et
- une seconde position dans laquelle le dispositif agit sur le piston mais non sur le cylindre de telle sorte qu'en utilisation, ledit piston est déplaçable axialement dans ledit cylindre de façon à expulser le médicament à travers l'aiguille ;

25 caractérisé par le fait que ledit boîtier interne (7) est déplaçable par la source d'énergie entre trois positions, à savoir :

30 - ladite première position dans laquelle le boîtier interne a une ou plusieurs pattes flexibles radialement (7B) en communication avec le cylindre de telle sorte qu'en

35

utilisation, les piston et cylindre sont déplaçables axialement de façon à déplacer au moins une partie de ladite aiguille hors du boîtier externe ;

- ladite seconde position dans laquelle le boîtier interne a une ou plusieurs pattes flexibles radialement (7A) en communication avec le piston mais non avec le cylindre de telle sorte qu'en utilisation, ledit piston est déplaçable axialement dans ledit cylindre de façon à expulser le médicament à travers l'aiguille ; et
- 10 - une troisième position dans laquelle lesdites pattes flexibles radialement (7A, 7B) sur le boîtier interne ne sont en communication ni avec le piston ni avec le cylindre de telle sorte qu'en utilisation, les piston et cylindre sont aptes à se rétracter afin de rétracter 15 l'aiguille dans le boîtier externe.

2 - Dispositif d'injection selon la revendication

1, à l'intérieur duquel sont situés :

- ledit cylindre pour contenir un volume d'un médicament ;
- ladite aiguille (10) à l'une des extrémités du cylindre ;
- 20 et
- ledit piston (8), déplaçable axialement à l'intérieur du cylindre.

3 - Dispositif d'injection selon la revendication 1 ou la revendication 2, comprenant en outre un boîtier de 25 ressort (41) dans une position intermédiaire entre le boîtier externe (30) et le boîtier interne (7).

4 - Dispositif d'injection selon l'une quelconque des revendications précédentes, dans lequel une ou plusieurs desdites pattes sont situées à l'extrémité d'un 30 bras élastiquement flexible.

5 - Dispositif d'injection selon l'une quelconque des revendications précédentes, dans lequel une ou plusieurs desdites pattes sont situées à l'extrémité arrière du boîtier interne et sont déplaçables radialement 35 dans et hors de communication avec le piston.

6 - Dispositif d'injection selon l'une quelconque des revendications 3 à 5, dans lequel lesdites pattes sont

sollicitées radialement vers l'intérieur en communication avec ledit piston, de préférence par communication avec ledit boîtier de ressort.

7 - Dispositif d'injection selon l'une quelconque 5 des revendications précédentes, dans lequel lesdites pattes sont maintenues dans leur condition relaxée, avant l'amorçage d'une injection.

8 - Dispositif d'injection selon l'une quelconque 10 des revendications 3 à 7, dans lequel chaque patte arrière est déplaçable hors de communication avec le piston lorsqu'elle est alignée avec une cavité correspondante dans le boîtier de ressort.

9 - Dispositif d'injection selon l'une quelconque 15 des revendications précédentes, dans lequel chaque patte arrière est sensiblement en forme de T.

10 - Dispositif d'injection selon l'une quelconque des revendications 1 à 4, dans lequel une ou 20 plusieurs desdites pattes sont situées à l'extrémité avant du boîtier interne et sont déplaçables radialement dans et hors de communication avec le cylindre.

11 - Dispositif d'injection selon la revendication 10, dans lequel lesdites pattes avant sont sollicitées radialement vers l'intérieur en communication avec ledit cylindre, de préférence par communication avec 25 ledit boîtier de ressort.

12 - Dispositif d'injection selon la revendication 10 ou la revendication 11, dans lequel lesdites pattes avant sont maintenues dans leur condition relaxée, avant l'amorçage d'une injection.

13 - Dispositif d'injection selon l'une quelconque des revendications 10 à 12, dans lequel chaque patte avant est déplaçable hors de communication avec le cylindre lorsqu'elle est alignée avec une cavité correspondante dans le boîtier de ressort.

14 - Dispositif d'injection selon l'une quelconque des revendications 10 à 13, dans lequel chaque patte avant est sensiblement en forme de L.

15 - Dispositif d'injection selon l'une quelconque des revendications précédentes, dans lequel ladite source d'énergie est un gaz comprimé.

16 - Dispositif d'injection selon l'une quelconque des revendications 1 à 14, dans lequel ladite source d'énergie est un ressort.

17 - Dispositif d'injection selon l'une quelconque des revendications précédentes, comprenant en outre un moyen pour permettre au boîtier interne de se déplacer axialement seulement vers l'avant par rapport au boîtier externe.

18 - Dispositif d'injection selon la revendication 17, dans lequel ledit moyen est un arrangement de dentelures, de barbes, de dents de rochet ou similaires dans une position intermédiaire entre les boîtiers.

19 - Dispositif d'injection selon l'une quelconque des revendications précédentes, comprenant en outre un moyen de guidage pour guider, en utilisation, le mouvement axial relatif des boîtiers de ressort et externe, le moyen de guidage comprenant de préférence une ou plusieurs saillies sur ledit boîtier de ressort, lesquelles, en utilisation, coopèrent avec des cavités correspondantes sur une surface intérieure dudit boîtier externe.

20 - Dispositif d'injection selon l'une quelconque des revendications précédentes, dans lequel ladite aiguille est sollicitée pour être normalement entièrement à l'intérieur dudit boîtier au moyen d'un ressort dans une position intermédiaire entre le cylindre et les boîtiers externe et/ou de ressort.

21 - Dispositif d'injection selon l'une quelconque des revendications précédentes, dans lequel l'aiguille est apte à être retirée dudit dispositif.

22 - Dispositif d'injection selon l'une quelconque des revendications précédentes, dans lequel

ladite aiguille, ledit cylindre et ledit piston sont aptes à être retirés dudit dispositif.

23 - Dispositif d'injection selon l'une quelconque des revendications précédentes, comprenant en 5 outre un étui protecteur d'aiguille apte à retiré, qui protège l'aiguille pendant le stockage avant l'utilisation.

24 - Dispositif d'injection selon la revendication 23, dans lequel ledit étui protecteur d'aiguille comprend un moyen pour tirer une gaine 10 protectrice en caoutchouc ou similaire à partir de ladite aiguille lorsque ledit étui protecteur d'aiguille est retiré du dispositif.

25 - Dispositif d'injection selon la revendication 24, dans lequel ledit moyen de traction 15 comprend un rivet flottant dans une position intermédiaire entre l'étui protecteur d'aiguille et la gaine protectrice en caoutchouc ou similaire, ce par quoi des forces de torsion appliquées audit étui protecteur d'aiguille sont sensiblement empêchées d'être transmises à ladite gaine en 20 caoutchouc ou similaire.

26 - Dispositif d'injection selon l'une quelconque des revendications 23 à 25, dans lequel la présence dudit étui protecteur d'aiguille sur ledit dispositif sert de verrou de sécurité, empêchant 25 sensiblement un mouvement vers l'avant relatif dudit boîtier externe.

27 - Dispositif d'injection selon l'une quelconque des revendications précédentes, comprenant en 30 outre une fenêtre d'observation dans ledit cylindre alignée avec une fenêtre d'observation dans ledit boîtier externe de telle sorte que ledit médicament peut être observé par un utilisateur avant qu'une injection n'ait lieu.

28 - Dispositif d'injection selon la revendication 27, dans lequel, en utilisation pendant une 35 injection, ledit boîtier interne se déplace dans une position intermédiaire entre ladite fenêtre d'observation

dans le boîtier externe et ledit cylindre de façon à cacher la fenêtre dans le cylindre à la vue de l'utilisateur.

29 - Dispositif d'injection selon l'une quelconque des revendications précédentes, comprenant en 5 outre un moyen pour émettre une indication audible et/ou physique à un utilisateur selon laquelle l'injection est terminée.

Ansprüche

1. Injektionsvorrichtung mit einem äußeren Gehäuse (30), das zur Aufnahme des Folgenden ausgestaltet ist:  
eines Spritzenkörpers zum Aufnehmen eines Volumens eines Medikaments,  
einer Kanüle (10) an einem Ende des Spritzenkörpers, wobei die Kanüle und der Spritzenkörper so beschaffen sind, dass wenigstens ein Teil der Kanüle axial in das äußere Gehäuse und aus dem äußeren Gehäuse (30) beweglich ist, aber so vorgespannt ist, dass sie normalerweise vollständig innerhalb des Gehäuses liegt, und  
eines Kolbens (8), der in dem Spritzenkörper axial beweglich ist,  
wobei die Injektionsvorrichtung weiter aufweist:  
ein inneres Gehäuse (7) zwischen äußerem Gehäuse und Spritzenkörper und Kolben, und  
eine Energiequelle (1; 40) in Verbindung mit dem inneren Gehäuse (7),  
wobei die Vorrichtung zwischen zwei Stellungen beweglich ist, nämlich  
einer ersten Stellung, in der die Vorrichtung auf den Kolben so einwirkt, dass bei Benutzung der Kolben und der Spritzenkörper axial beweglich sind, um so wenigstens einen Teil der Kanüle aus dem äußeren Gehäuse heraus zu bewegen, und  
einer zweiten Stellung, in der die Vorrichtung auf den Kolben einwirkt, aber nicht auf den Spritzenkörper, so dass bei Benutzung der Kolben axial in den Spritzenkörper hinein beweglich ist, um so Medikament durch die Kanüle auszustoßen,  
dadurch gekennzeichnet, dass das innere Gehäuse (7) durch die Energiequelle zwischen drei Stellungen beweglich ist,  
nämlich

der ersten Stellung, in der das innere Gehäuse einen oder mehrere radial flexible Fortsätze (7B) in Verbindung mit dem Spritzenkörper hat, so dass bei Benutzung der Kolben und der Spritzenkörper axial beweglich sind, um so wenigstens einen Teil der Kanüle aus dem äußeren Gehäuse heraus zu bewegen,

der zweiten Stellung, in der das innere Gehäuse einen oder mehrere radial flexible Fortsätze (7A) in Verbindung mit dem Kolben, aber nicht mit dem Spritzenkörper hat, so dass bei Benutzung der Kolben axial in den Spritzenkörper beweglich ist, um so Medikament durch die Kanüle auszustößen, und

einer dritten Stellung, in der die radial flexiblen Fortsätze (7A, 7B) an dem inneren Gehäuse weder in Verbindung mit dem Kolben noch mit dem Spritzenkörper sind, so dass bei Benutzung der Kolben und der Spritzenkörper dazu in der Lage sind, sich zurückzuziehen, um die Kanüle in das äußere Gehäuse hinein zurückzuziehen.

2. Injektionsvorrichtung nach Anspruch 1, innerhalb der angeordnet sind:  
der Spritzenkörper zum Aufnehmen eines Volumens eines Medikaments,  
die Kanüle (10) an einem Ende des Spritzenkörpers, und  
der Kolben (8), der axial beweglich innerhalb des Spritzenkörpers ist.
3. Injektionsvorrichtung nach Anspruch 1 oder Anspruch 2, die weiter ein Federgehäuse (41) zwischen dem äußeren Gehäuse (30) und dem inneren Gehäuse (7) aufweist.
4. Injektionsvorrichtung nach einem der vorhergehenden Ansprüche, wobei einer oder mehrere der Fortsätze am Ende eines elastisch flexiblen Stegs angeordnet sind.

5. Injektionsvorrichtung nach einem der vorhergehenden Ansprüche, wobei einer oder mehrere der Fortsätze am hinteren Ende des inneren Gehäuses angeordnet sind und radial in und außer Verbindung mit dem Kolben beweglich sind.
6. Injektionsvorrichtung nach einem der Ansprüche 3 bis 5, wobei die Fortsätze mit einer Vorspannung radial nach innen in Verbindung mit dem Kolben beaufschlagt sind, vorzugsweise durch Verbindung mit dem Federgehäuse.
7. Injektionsvorrichtung nach einem der vorhergehenden Ansprüche, wobei die Fortsätze in ihren entspannten Zustand in Ruhestellung gebracht sind, bevor eine Injektion eingeleitet wird.
8. Injektionsvorrichtung nach einem der Ansprüche 3 bis 7, wobei jeder hintere Fortsatz in und außer Verbindung mit dem Kolben beweglich ist, wenn er mit einer entsprechenden Vertiefung in dem Federgehäuse ausgerichtet ist.
9. Injektionsvorrichtung nach einem der vorhergehenden Ansprüche, wobei jeder hintere Fortsatz im Wesentlichen T-förmig ist.
10. Injektionsvorrichtung nach einem der Ansprüche 1 bis 4, wobei einer oder mehrere der Fortsätze am vorderen Ende des inneren Gehäuses angeordnet sind und radial in und außer Verbindung mit dem Kolben beweglich sind.
11. Injektionsvorrichtung nach Anspruch 10, wobei die vorderen Fortsätze radial nach innen in Verbindung mit dem Kolben vorgespannt sind, vorzugsweise durch Verbindung mit dem Federgehäuse.

12. Injektionsvorrichtung nach Anspruch 10 oder Anspruch 11, wobei die vorderen Fortsätze in ihren entspannten Zustand in Ruhestellung gebracht sind, bevor eine Injektion eingeleitet wird.
13. Injektionsvorrichtung nach einem der Ansprüche 10 bis 12, wobei jeder vordere Fortsatz außer Verbindung mit dem Kolben beweglich ist, wenn er mit einer entsprechenden Vertiefung in dem Federgehäuse ausgerichtet ist.
14. Injektionsvorrichtung nach einem der Ansprüche 10 bis 13, wobei jeder vordere Fortsatz im Wesentlichen L-förmig ist.
15. Injektionsvorrichtung nach einem der vorhergehenden Ansprüche, wobei die Energiequelle ein komprimiertes Gas ist.
16. Injektionsvorrichtung nach einem der Ansprüche 1 bis 14, wobei die Energiequelle eine Feder ist.
17. Injektionsvorrichtung nach einem der vorhergehenden Ansprüche, die weiter Mittel umfasst, die dem inneren Gehäuse eine axiale Bewegung nur vorwärts in Bezug auf das äußere Gehäuse gestatten.
18. Injektionsvorrichtung nach Anspruch 17, wobei die Mittel eine Anordnung von Rippen, Widerhaken, Sperrklinken oder dergleichen zwischen den Gehäusen sind.
19. Injektionsvorrichtung nach einem der vorhergehenden Ansprüche, die weiter eine Führungseinrichtung aufweist, um bei Benutzung die relative axiale Bewegung von Feder- und äußerem Gehäuse zu führen, wobei die Führungseinrichtung vorzugsweise einen oder mehrere Fortsätze an dem Federgehäuse umfasst, der oder die bei Benutzung mit entsprechen-

den Vertiefungen an einer Innenfläche des äußeren Gehäuses zusammenwirken.

20. Injektionsvorrichtung nach einem der vorhergehenden Ansprüche, wobei die Kanüle mittels einer Feder zwischen dem Kolben und dem äußeren und/oder Federgehäuse in eine normalerweise vollständig innerhalb des Gehäuses liegende Stellung vorgespannt ist.
21. Injektionsvorrichtung nach einem der vorhergehenden Ansprüche, wobei die Kanüle von der Vorrichtung abnehmbar ist.
22. Injektionsvorrichtung nach einem der vorhergehenden Ansprüche, wobei die Kanüle, der Spritzenkörper und der Kolben aus der Vorrichtung entfernbar sind.
23. Injektionsvorrichtung nach einem der vorhergehenden Ansprüche, die weiter eine abnehmbare Kanülenkappe aufweist, die die Kanüle während der Aufbewahrung vor ihrer Benutzung schützt.
24. Injektionsvorrichtung nach Anspruch 23, wobei die Kanülenkappe Mittel aufweist, um eine Schutzgummihülle oder dergleichen von der Kanüle abzuziehen, wenn die Kanülenkappe von der Vorrichtung abgenommen wird.
25. Injektionsvorrichtung nach Anspruch 24, wobei die Abziehmittel einen beweglichen Bolzen zwischen der Kanülenkappe und der Schutzgummihülle oder dergleichen umfassen, wodurch auf die Kanülenkappe ausgeübte Drehkräfte im Wesentlichen an der Übertragung auf die Gummihülle oder dergleichen gehindert werden.

26. Injektionsvorrichtung nach einem der Ansprüche 23 bis 25, wobei das Vorhandensein der Kanülenkappe an der Vorrichtung als ein Sicherheitsverschluss dient, der im Wesentlichen eine relative Vorwärtsbewegung des äußeren Gehäuses verhindert.
27. Injektionsvorrichtung nach einem der vorhergehenden Ansprüche, die weiter ein Sichtfenster in dem Spritzenkörper ausgerichtet mit einem Sichtfenster in dem äußeren Gehäuse aufweist, so dass das Medikament von einem Benutzer betrachtet werden kann, bevor eine Injektion stattfindet.
28. Injektionsvorrichtung nach Anspruch 27, wobei bei der Anwendung während einer Injektion das innere Gehäuse sich zwischen das Sichtfenster in dem äußeren Gehäuse und in dem Spritzenkörper bewegt, um so das Fenster in dem Spritzenkörper für den Betrachter unsichtbar zu machen.
29. Injektionsvorrichtung nach einem der vorhergehenden Ansprüche, die weiter eine Einrichtung zur Aussendung einer akustischen und/oder physikalischen Anzeige für den Benutzer, dass die Injektion abgeschlossen ist, aufweist.

Application No. 05 701 985.3 - 2310	Ref. P103497EP	Date 30.04.2007
Applicant The Medical House Plc		

#### Communication under Rule 51(4) EPC

You are informed that the Examining Division intends to grant a European patent on the basis of the above application with the text and drawings as indicated below:

In the text for the Contracting States:

AT BE BG CH CY CZ DE DK EE ES FI FR GB GR HU IE IS IT LI LT LU MC NL PL PT RO SE SI SK TR

#### Description, Pages

9-26 as published  
1-7 filed with telefax on 10.11.2006

#### Claims, Numbers

2-29 filed with telefax on 10.11.2006  
1 filed with telefax on 13.03.2007

#### Drawings, Sheets

1/27-27/27 as published

A copy of relevant documents is enclosed

The title of the invention in the three official languages of the European Patent Office, the international patent classification, the designated Contracting States, the registered name of the applicant and the bibliographic data are shown on the attached EPO Form 2056.

You are requested within a **non-extendable** period of four months of notification of this communication

1. to file 1 set of translations of the claim(s) in the two other EPO official languages;	EUR
2a. to pay the fee for grant including the fee for printing up to and including 35 pages; Reference 007	750.00
2b. to pay the printing fee for the 36th and each additional page; number of pages: 22 Reference 008	242.00
3. to pay the additional claim fee(s) (Rule 51(7) EPC); number of claims fees payable: Reference 016	0.00
Total amount	992.00

Concerning the possibility of a request for accelerated grant pursuant to Article 97(6) EPC, reference is made to OJ EPO 2001, 459.

If you do not approve the text intended for grant but wish to request amendments or corrections, the procedure described in Rule 51(5) EPC is to be followed.

If this communication is based upon an auxiliary request, and you reply within the time limit set that you maintain the main or a higher ranking request which is not allowable, the application will be refused (Article 97(1) EPC, see also Legal Advice 15/05 (rev. 02), OJ 6/2005, 357).

If the enclosed claims contain amendments proposed by the Examining Division, and you reply within the time limit set that you cannot accept these amendments, refusal of the application under Article 97(1) EPC would result in the case that agreement cannot be reached on the text for grant.

In all cases except those of the previous two paragraphs, if the grant, printing or claims fees are not paid, or the translations not filed, in due time, the European patent application will be deemed to be withdrawn (Rule 51(8) EPC).

For all payments you are requested to use EPO Form 1010 or to refer to the relevant reference number.

After publication, the European patent specification can be downloaded free of charge from the EPO publication server <https://publications.european-patent-office.org> or ordered only from the Vienna sub-office upon payment of a fee (OJ EPO 2005, 126).

Upon request in writing each proprietor will receive the certificate for the European patent **together with one copy** of the patent specification only if the request is filed within the time limit of Rule 51(4) EPC. If such request has been previously filed, it has to be confirmed within the time limit of Rule 51(4) EPC. The requested copy is free of charge. If the request is filed after expiry of the Rule 51(4) EPC time limit, the certificate will be delivered without a copy of the patent specification.

#### Translation of the priority document(s)

If the translation of the priority document(s), as required by Article 88(1) EPC, or the declaration according to Rule 38(5) EPC has not yet been filed, Form 2530 will be despatched separately. The translation is to be filed within the above mentioned time limit (Rule 38(5) EPC).

#### Note on payment of renewal fees

If a renewal fee falls due between notification of the present communication and the proposed date of publication of the mention of the grant of the European patent, publication will be effected only after the renewal fee and any additional fee have been paid (Rule 51(9) EPC).

Under Article 86(4) EPC, renewal fees are payable to the European Patent Office until the year in which the mention of the grant of the European patent is published.

Filing of translations in the Contracting States

Pursuant to Article 65(1) EPC the following Contracting States require a translation of the specification of the European patent in their/one of their official language(s) (Rule 51(10) EPC), **insofar** this specification will not be published in their/one of their official language(s)

- within **three** months of publication of the mention of such decision:

AT	AUSTRIA	GR	GREECE
BE	BELGIUM	HU	HUNGARY
BG	BULGARIA	IS	ICELAND
CH	SWITZERLAND / LIECHTENSTEIN	IT	ITALY
CY	CYPRUS	LT	LITHUANIA
CZ	CZECH REPUBLIC	NL	NETHERLANDS
DE	GERMANY	PL	POLAND
DK	DENMARK	PT	PORTUGAL
EE	ESTONIA	RO	ROMANIA
ES	SPAIN	SE	SWEDEN
FI	FINLAND	SI	SLOVENIA
FR	FRANCE	SK	SLOVAKIA
GB	UNITED KINGDOM	TR	TURKEY

- within **six** months of publication of the mention of such decision:

IE	IRELAND
----	---------

The date on which the European Patent Bulletin publishes the mention of the grant of the European patent will be indicated in the decision on the grant of the European patent (EPO Form 2006).

In case of a valid extension the following Extension States require a translation of the **claims** in their official language within **three** months after publication of the mention of the grant of the European patent:

AL	ALBANIA	LV	LATVIA
BA	BOSNIA-HERZEGOVINA	MK	MACEDONIA
HR	CROATIA *	YU	SERBIA AND MONTENEGRO

\* requires translation of the specification

The translation must be filed with the national Patent Offices of the Contracting or Extension States in accordance with the provisions applying thereto in the State concerned. Further details (e.g. appointment of a national representative or indication of an address for service within the country) are given in the EPO information brochure "National law relating to the EPC", and in the supplementary information published in the Official Journal of the EPO, or available on the EPO website.

Failure to supply such translation to the Contracting and Extension States in time and in accordance with the requirements may result in the patent being deemed to be void ab initio in the State concerned.

Note to users of the automatic debiting procedure

Date 30.04.2007

Sheet 4

Application No.: 05 701 985.3

Unless the EPO receives prior instructions to the contrary, the fee(s) will be debited on the last day of the period of payment. For further details see the Arrangements for the automatic debiting procedure (see Supplement to OJ EPO 2, 2002).

Dear Sirs

**European Patent Application No 05701985.3**  
**Injection Device**  
**The Medical House plc**

I would be grateful if you could inform me when we could expect to receive the Communication under 51(4) in connection with the above mentioned application. In accordance with the PACE request filed 27 September 2006, the applicant seeks grant as soon as possible.

Two copies of EPO Form 1037 are enclosed, and I should be grateful if you could stamp one of these and return it to us immediately as acknowledgement of receipt of this letter.

Yours faithfully

Dear Sirs

**European Patent Application No 05701985.3**  
**Auto Safety Injector**  
**The Medical House plc**

With reference to my telephone and email correspondence with Examiner Reinbold today, we are filing herewith replacement page 25 of the claims in which claim 1 has been amended to improve the two-part form. A marked-up copy of the replacement page is also enclosed for the Examiner's reference.

The deletion of any subject matter from the present application should not be construed as abandonment of that subject matter and is not without prejudice to its reinstatement or to filing a divisional application for that subject matter.

The examiner is invited to contact the undersigned if any point remains outstanding that can be usefully resolved by telephone or email.

Oral proceedings are requested if the examiner contemplates refusing the application.

## CLAIMS

1. An injection device comprising an outer housing (30) adapted to receive:  
a barrel for holding a volume of a medicament;  
a needle (10) at one end of the barrel, the  
needle and barrel being such that at least part of the needle is axially moveable in and out of  
said outer housing (30) but is biased to be normally wholly inside said housing; and  
a plunger (8), axially moveable within the  
barrel,  
wherein the injection device further comprises:  
an inner housing (7) intermediate the outer  
housing and the barrel and plunger; and  
an energy source (1; 40) in communication with said inner housing (7),  
characterised in that  
the device being moveable between two positions, namely  
a first position in which the device acts on the barrel such that, in use, the plunger  
and barrel are movable axially so as to move at least part of said needle out of the outer  
housing; and  
a second position in which the device acts on the plunger but not the barrel such  
that, in use, said plunger is movable axially into said barrel so as to expel medicament  
through the needle;  
characterised in that said inner housing (7) is moveable by the energy source between three  
positions, namely  
a-said first position in which the inner housing has one or more radially flexible tags  
(7B) in communication with the barrel such that, in use, the plunger and barrel are movable  
axially so as to move at least part of said needle out of the outer housing;  
a-said second position in which the inner housing has one or more radially flexible  
tags (7A) in communication with the plunger but not the barrel such that, in use, said  
plunger is movable axially into said barrel so as to expel medicament through the needle;  
and  
a third position in which said radially flexible tags (7A, 7B) on the inner housing are  
in communication with neither the plunger nor the barrel such that, in use, the plunger and  
barrel are able to retract in order to retract the needle into the outer housing.

## CLAIMS

1. An injection device comprising an outer housing (30) adapted to receive:  
a barrel for holding a volume of a medicament;  
a needle (10) at one end of the barrel, the  
needle and barrel being such that at least part of the needle is axially moveable in and out of  
said outer housing (30) but is biased to be normally wholly inside said housing; and  
a plunger (8), axially moveable within the  
barrel,  
wherein the injection device further comprises:  
an inner housing (7) intermediate the outer  
housing and the barrel and plunger; and  
an energy source (1; 40) in communication with said inner housing (7),  
the device being moveable between two positions, namely  
a first position in which the device acts on the barrel such that, in use, the plunger  
and barrel are movable axially so as to move at least part of said needle out of the outer  
housing; and  
a second position in which the device acts on the plunger but not the barrel such  
that, in use, said plunger is movable axially into said barrel so as to expel medicament  
through the needle;  
characterised in that said inner housing (7) is moveable by the energy source between three  
positions, namely  
said first position in which the inner housing has one or more radially flexible tags  
(7B) in communication with the barrel such that, in use, the plunger and barrel are movable  
axially so as to move at least part of said needle out of the outer housing;  
said second position in which the inner housing has one or more radially flexible  
tags (7A) in communication with the plunger but not the barrel such that, in use, said  
plunger is movable axially into said barrel so as to expel medicament through the needle;  
and  
a third position in which said radially flexible tags (7A, 7B) on the inner housing are  
in communication with neither the plunger nor the barrel such that, in use, the plunger and  
barrel are able to retract in order to retract the needle into the outer housing.

Dear Sirs

**European Patent Application No 05701985.3**  
**Auto Safety Injector**  
**The Medical House plc**

With reference to my telephone and email correspondence with Examiner Reinbold today, we are filing herewith replacement page 25 of the claims in which claim 1 has been amended to improve the two-part form. A marked-up copy of the replacement page is also enclosed for the Examiner's reference.

The deletion of any subject matter from the present application should not be construed as abandonment of that subject matter and is not without prejudice to its reinstatement or to filing a divisional application for that subject matter.

The examiner is invited to contact the undersigned if any point remains outstanding that can be usefully resolved by telephone or email.

Oral proceedings are requested if the examiner contemplates refusing the application.

## CLAIMS

1. An injection device comprising an outer housing (30) adapted to receive:  
a barrel for holding a volume of a medicament;  
a needle (10) at one end of the barrel, the  
needle and barrel being such that at least part of the needle is axially moveable in and out of  
said outer housing (30) but is biased to be normally wholly inside said housing; and  
a plunger (8), axially moveable within the  
barrel,  
wherein the injection device further comprises:  
an inner housing (7) intermediate the outer  
housing and the barrel and plunger; and  
an energy source (1; 40) in communication with said inner housing (7),  
characterised in that  
the device being moveable between two positions, namely  
a first position in which the device acts on the barrel such that, in use, the plunger  
and barrel are movable axially so as to move at least part of said needle out of the outer  
housing; and  
a second position in which the device acts on the plunger but not the barrel such  
that, in use, said plunger is movable axially into said barrel so as to expel medicament  
through the needle;  
characterised in that said inner housing (7) is moveable by the energy source between three  
positions, namely  
a-said first position in which the inner housing has one or more radially flexible tags  
(7B) in communication with the barrel such that, in use, the plunger and barrel are movable  
axially so as to move at least part of said needle out of the outer housing;  
a-said second position in which the inner housing has one or more radially flexible  
tags (7A) in communication with the plunger but not the barrel such that, in use, said  
plunger is movable axially into said barrel so as to expel medicament through the needle;  
and  
a third position in which said radially flexible tags (7A, 7B) on the inner housing are  
in communication with neither the plunger nor the barrel such that, in use, the plunger and  
barrel are able to retract in order to retract the needle into the outer housing.

## CLAIMS

1. An injection device comprising an outer housing (30) adapted to receive:  
a barrel for holding a volume of a medicament;  
a needle (10) at one end of the barrel, the  
needle and barrel being such that at least part of the needle is axially moveable in and out of  
said outer housing (30) but is biased to be normally wholly inside said housing; and  
a plunger (8), axially moveable within the  
barrel,  
wherein the injection device further comprises:  
an inner housing (7) intermediate the outer  
housing and the barrel and plunger; and  
an energy source (1; 40) in communication with said inner housing (7),  
the device being moveable between two positions, namely  
a first position in which the device acts on the barrel such that, in use, the plunger  
and barrel are movable axially so as to move at least part of said needle out of the outer  
housing; and  
a second position in which the device acts on the plunger but not the barrel such  
that, in use, said plunger is movable axially into said barrel so as to expel medicament  
through the needle;  
characterised in that said inner housing (7) is moveable by the energy source between three  
positions, namely  
said first position in which the inner housing has one or more radially flexible tags  
(7B) in communication with the barrel such that, in use, the plunger and barrel are movable  
axially so as to move at least part of said needle out of the outer housing;  
said second position in which the inner housing has one or more radially flexible  
tags (7A) in communication with the plunger but not the barrel such that, in use, said  
plunger is movable axially into said barrel so as to expel medicament through the needle;  
and  
a third position in which said radially flexible tags (7A, 7B) on the inner housing are  
in communication with neither the plunger nor the barrel such that, in use, the plunger and  
barrel are able to retract in order to retract the needle into the outer housing.

Dear Sirs

**European Patent Application No 05701985.3**  
**Auto Safety Injector**  
**The Medical House plc**

We are writing in response to your communication pursuant to Article 96(2) EPC dated 30 October 2006. A PACE Request was filed 27.09.2006 and we respectfully request that this response is handled as quickly as possible.

With this letter we are filing the following replacement pages, amended in light of the examiner's comments:

**Description:** pages 2-7 (previous page 8 should be removed and the remaining pages renumbered accordingly)  
**Claims:** Claims 1-29

A further copy of the relevant pages is enclosed on which the amendments have been indicated for the examiner's reference.

**Clarity – Article 84 EPC**

The examiner objected to the three independent claims 1, 29 and 30. Whilst the applicant does not believe there to be a lack of clarity, in the interest of expedient prosecution, claim 29 has been deleted. Claim 30 has been recast as the main claim, with former claim 1 dependent thereon, so that there now is only one independent claim in this application. Basis for making claim 30 be the main claim with the other claims dependent thereon is found in former claim 31, which has also now been deleted.

**Other Matters**

The paragraph numbering below corresponds with the paragraph numbering in the examiner's communication.

3. Reference signs in parentheses have been added to new claim 1 (former claim 30).
4. Former claim 1 was indeed already in two-part form, but this issue is no longer relevant given the amendment to this claim, which is now dependent claim 2. New claim 1 (former claim 30) is also already in two-part form.
5. Document D1 was already identified and discussed on page 2 of the description filed upon entry into the European regional phase. Document D2 is identified and discussed on replacement page 2 filed herewith. D2, namely WO03/097133 (Owen Mumford) discloses an injection device with a retractable needle but with the driving force applied to the liquid inside the syringe, using the liquid's incompressible nature to cause the needle to move forward. A relatively complex arrangement is required for this and it is desirable to provide an injection device wherein the forward driving force is applied to the syringe, not to the liquid drug therein.
6. As already identified by the examiner, there is a critical difference between the D1 and D2 devices. The D1 device applies driving force to the flange of the syringe barrel in order to move the needle forward, ready for injection. In contrast, the D2 device applies driving force to the liquid drug itself inside the syringe, using its incompressible nature to cause the needle to move forward, ready for injection. These two different types of technology are incompatible with one another.

Regarding inventive step, the closest prior art appears to be D1. Taking this as a starting point, the technical problem to be solved is how to provide an injection device wherein the needle automatically retracts into the housing after injection.

Starting with the teaching of the D1, and assuming the skilled person wanted to modify the D1 device so that its needle could retract after the injection, there is no reason why the skilled reader would look to the teaching of D2 to supply the missing feature, given the significant technical differences between the D1 and D2 devices.

Even if the skilled person tried to combine the teachings of D1 and D2 in order to make the D1 device have a retractable needle, D2 would lead him to modify the pressure plate 26 and end 112 of the ejection member of D1 into an arrangement equivalent to the rod end 27A and aperture in the drive member 8 of D2, so that the "retractable" D1 device would be of the type which applies driving force to the liquid drug inside the syringe i.e. leading further away from the invention claimed in the present application.

In other words, either the device acts on the barrel to move the needle forward (as in D1), in which case the needle cannot retract, or the device acts on the liquid drug to move the needle forward (as in D2), in which case the needle can retract but the inner housing is never "intermediate the outer housing and the barrel and plunger" as required by claim 1.

It is therefore clear that the claimed invention is not obvious in light of D1 and D2.

3  
10 November 2006  
HGF - VJS/P103497EP

7. The description has been brought into conformity with the amended claims on replacement pages 2-8 filed herewith.

The deletion of any subject matter from the present application should not be construed as abandonment of that subject matter and is not without prejudice to its reinstatement or to filing a divisional application for that subject matter.

The examiner is invited to contact the undersigned if any point remains outstanding that can be usefully resolved by telephone.

Oral proceedings are requested if the examiner contemplates refusing the application.

I enclose two copies of EPO Form 1037, and I should be grateful if you would stamp and return one of these to us immediately as an acknowledgement of receipt of this letter and enclosures.

Yours faithfully

Vanessa Stainthorpe  
European Patent Attorney  
For and on behalf of Harrison Goddard Foote

## INJECTION DEVICE

This invention relates to the field of injection devices for the administration of liquid medication, for example, 5 insulin or growth hormone.

One type of injection device is known as a mini-needle or micro-needle device. These devices comprise a pressurised ("forced") injection system and have a needle which is 10 shorter than that of conventional needle systems. The needle is normally hidden which is advantageous both for avoiding needle stick injuries and for minimising trauma to needle-phobic patients. The needle is hidden both before and after the injection is delivered, appearing 15 only for the duration of the injection. Mini needle devices can typically deliver a larger volume of medication than needle-free devices and can deliver faster than conventional needle systems.

20 One such known device is described in WO00/09186 (Medi-Ject Corporation) for "Needle assisted jet injector" and this document gives a useful summary of prior art devices.

25 The device of WO 00/09186 includes a needle which is, in one embodiment, retractably located within an injector nozzle assembly. Upon activation of a force generating source, a portion of the needle extends past the nozzle assembly and penetrates the outer layer of skin to 30 deliver medicament via jet injection to a deeper region. After activation, the needle retracts back into the nozzle assembly. The retractable needle is housed within the nozzle and is pushed forward so that it emerges in order to deliver an injection by the liquid medicament 35 itself, when the medicament is itself pushed forward by the plunger.

An alternative way of concealing the needle after an injection has been delivered is described in US6544234 (BD Medico SARL), which discloses an injection device in 5 which the needle is concealed before injection, but the configuration of the device is such that the needle cannot retract after injection. Instead, there is a moveable needle protection sleeve which is displaced by a compression spring when the needle is pulled out of the 10 subcutaneous tissue in order to conceal the needle from the patient.

WO03/097133 (Owen Mumford) discloses an injection device with a retractable needle but with driving force applied 15 to the liquid inside the syringe, using the liquid's incompressible nature to cause the needle to move forward. A relatively complex arrangement is required for this and it would be desirable to provide an injection device wherein the forward driving force is 20 applied to the syringe, not to the liquid drug therein.

Although the present invention may relate to mini-needle or jet injection devices, the invention is equally applicable to other types of injection device, for 25 example those for deep-penetrating muscular injection as well as those which are for shallower, subcutaneous, injection.

According to a first aspect of the present invention 30 there is provided an injection device comprising an outer housing adapted to receive

    a barrel for holding a volume of a medicament;  
    a needle at one end of the barrel, the needle and barrel being such that at least part of the needle is 35 axially moveable in and out of said outer housing but is biased to be normally wholly inside said housing;

a plunger, axially moveable within the barrel;  
an inner housing intermediate the outer housing and  
the barrel and plunger; and  
an energy source in communication with said inner  
5 housing,  
wherein the inner housing is moveable by the energy  
source between three positions, namely  
a first position in which the inner housing is in  
communication with both the plunger and the barrel such  
10 that, in use, the plunger and barrel are movable axially  
so as to move at least part of said needle out of the  
outer housing;  
a second position in which the inner housing is in  
communication with the plunger but not the barrel such  
15 that, in use, said plunger is movable axially into said  
barrel so as to expel medicament through the needle; and  
a third position in which the inner housing is in  
communication with neither the plunger nor the barrel  
such that, in use, the plunger and barrel are able to  
20 retract in order to retract the needle into the outer  
housing.

The injection device according to the present invention  
provides a simple and cost-effective means of delivering  
25 medicament through a retractable needle. If desired, the  
device is able to deliver medicament to a depth beyond  
the length of the needle because of the propulsive force  
provided by the energy source. As mentioned above, the  
injection device is equally suitable for needle-assisted  
30 jet injection (delivering medicament to a depth beyond  
the length of the needle), conventional injection (to the  
depth of the needle penetration), or even to a user-  
adjustable needle penetration depth.

35 The device requires that the needle (and hence also the  
barrel to which it is normally fixed) is moved axially so

that the needle can appear beyond the end of the nozzle for the duration of the injection, after which the needle retracts automatically, out of sight of the user. The device also requires that the plunger is moved axially (into the barrel) so that medicament is ejected. The overall complexity of the injection device is significantly reduced by both of these requirements being effected by one component, namely the inner housing.

10 Preferably, the injection device comprises an outer housing inside which is located said barrel, said needle and said plunger.

15 Preferably, said inner housing includes one or more radially flexible tags, each preferably located at the end of a resiliently flexible leg.

20 Preferably, one or more of said tags are situated at the rear end of the inner housing and are moveable radially into and out of communication with the plunger. In one embodiment, the tags are biased radially inwardly into communication with the plunger, preferably by communication with the outer housing. Alternatively, the tags are stored in their relaxed condition, before an

25 injection is initiated.

30 Each rear tag may be moveable out of communication with the plunger when aligned with a corresponding recess in the outer housing. Preferably, each rear tag is substantially T-shaped. One leg of the T-shape enables the rear tag to hook over the plunger and, effectively, pull the plunger forward (in the first and second positions mentioned above). The other leg of the T-shape enables the rear tag to move radially outwardly to catch

35 in a recess in the housing (in the third position mentioned above).

Preferably, one or more of said tags are situated at the forward end of the inner housing and are moveable radially into and out of communication with the barrel.

5 In one embodiment, the forward tags are biased radially inwardly into communication with the barrel, preferably by communication with the outer housing. Alternatively, the forward tags are stored in their relaxed condition, before initiating an injection.

10 Each forward tag may be moveable out of communication with the barrel when aligned with a corresponding recess in the outer housing. Preferably, each rear tag is substantially L-shaped.

15 In a preferred embodiment, said energy source is a compressed gas. Alternatively, said energy source is a spring.

20 Preferably, the injection device further includes means for allowing the inner housing to move axially only forward with respect to the outer housing. Ideally, said means is an arrangement of serrations, barbs, ratchet teeth or the like intermediate the housings.

25 Preferably, the injection device further comprises guide means for guiding, in use, the relative axial movement of the inner and outer housings, the guide means preferably comprising one or more protrusions on said inner housing

30 which, in use, cooperate with corresponding recesses on an interior surface of said outer housing.

35 Preferably, said needle is biased to be normally wholly inside said housing by means of a spring intermediate the barrel and the outer housing.

In one embodiment, the needle is removable from the device, this being of benefit in applications where the device is reusable (for example if a multiple-use cartridge of medicament is utilised).

5

In a further embodiment, said needle, barrel and plunger are removable from said device. It is intended that the device of the present invention could be constructed around a standard needle, barrel and plunger of known type.

10 Preferably, the injection device further includes a removable needle cover which protects the needle during storage and before use. Advantageously, said needle cover includes means for pulling a protective rubber sheath or the like from said needle when said needle cover is removed from the device. Said pulling means may include a floating rivet intermediate the needle cover and the protective rubber sheath or the like, whereby twisting 15 forces applied to said needle cover are substantially prevented from being transmitted to said rubber sheath or the like.

20 Preferably, the presence of said needle cover on said device serves as a safety lock, substantially preventing relative forward movement of said outer housing.

25 In a preferred form, the injection device further comprises a viewing window in said barrel aligned with a 30 viewing window in said outer housing such that said medicament can be viewed by a user prior to an injection taking place. Preferably, in use during an injection, said inner housing moves intermediate said viewing window in the outer housing and said barrel so as to obscure the 35 window in the barrel from the user's view.

Preferably, the injection device includes means for emitting an audible and/or physical indication to a user that the injection is complete.

5 Preferred embodiments of the present invention will now be more particularly described, by way of example only, with reference to the accompanying drawings wherein:

10 Figure 1 is a perspective view, partly in section, showing the injection device, in the condition in which it is supplied to a user, apart from the needle cover;

15 Figure 2, drawn to a larger scale, shows detail of part of the device shown in Figure 1;

Figure 3 is a perspective view, partly in section, showing the injection device, during an injection;

20 Figure 4, drawn to a larger scale, shows detail of part of the device shown in Figure 3;

Figure 5 is a perspective view, partly in section, showing the injection device, with the plunger fully depressed into the barrel;

25 Figure 6, drawn to a larger scale, shows detail of part of the device shown in Figure 5;

Figure 7 is a perspective view, partly in section,

## CLAIMS

1. An injection device comprising an outer housing (30) adapted to receive:
  - 5 a barrel for holding a volume of a medicament; a needle (10) at one end of the barrel, the needle and barrel being such that at least part of the needle is axially moveable in and out of said outer housing (30) but is biased to be normally wholly inside said housing; and
  - 10 a plunger (8), axially moveable within the barrel, wherein the injection device further comprises:
    - 15 an inner housing (7) intermediate the outer housing and the barrel and plunger; and an energy source (1; 40) in communication with said inner housing (7), characterised in that the inner housing (7) is moveable by the energy source between three positions, namely
    - 20 a first position in which the inner housing has one or more radially flexible tags (7B) in communication with the barrel such that, in use, the plunger and barrel are movable axially so as to move at least part of said needle out of the outer housing;
    - 25 a second position in which the inner housing has one or more radially flexible tags (7A) in communication with the plunger but not the barrel such that, in use, said plunger is movable axially into said barrel so as to expel medicament through the needle; and
    - 30 a third position in which said radially flexible tags (7A, 7B) on the inner housing are in communication with neither the plunger nor the barrel such that, in use, the plunger and barrel are able to retract in order to retract the needle into the outer housing.

2. The injection device of claim 1 inside which is located  
said barrel for holding a volume of a  
5 medicament;  
said needle (10) at one end of the barrel; and  
said plunger (8), axially moveable within the  
barrel.

10 3. An injection device as claimed in claim 1 or  
claim 2 further comprising a spring housing (41)  
intermediate the outer housing (30) and the inner  
housing (7).

15 4. An injection device as claimed in any of the  
preceding claims wherein one or more of said tags is  
located at the end of a resiliently flexible leg.

20 5. An injection device as claimed in any of the  
preceding claims wherein one or more of said tags are  
situated at the rear end of the inner housing and are  
moveable radially into and out of communication with  
the plunger.

25 6. An injection device as claimed in any of claims  
3-5 wherein said tags are biased radially inwardly into  
communication with said plunger, preferably by  
communication with said spring housing.

30 7. An injection device as claimed in any of the  
preceding claims wherein said tags are stored in their  
relaxed condition, before initiating an injection.

35 8. An injection device as claimed in any of claims  
3-7 wherein each rear tag is moveable out of  
communication with the plunger when aligned with a

corresponding recess in the spring housing.

9. An injection device as claimed in any of the preceding claims wherein each rear tag is substantially 5 T-shaped.

10. An injection device as claimed in any of claims 1-4 wherein one or more of said tags are situated at the forward end of the inner housing and are moveable 10 radially into and out of communication with the barrel.

11. An injection device as claimed in claim 10 wherein said forward tags are biased radially inwardly 15 into communication with said barrel, preferably by communication with said spring housing.

12. An injection device as claimed in claim 10 or claim 11 wherein said forward tags are stored in their relaxed condition, before initiating an injection.

20 13. An injection device as claimed in any of claims 10-12 wherein each forward tag is moveable out of communication with the barrel when aligned with a corresponding recess in the spring housing.

25 14. An injection device as claimed in any of claims 10-13 wherein each forward tag is substantially L-shaped.

30 15. An injection device as claimed in any of the preceding claims wherein said energy source is a compressed gas.

35 16. An injection device as claimed in any of claims 1-14 wherein said energy source is a spring.

17. An injection device as claimed in any of the preceding claims further including means for allowing the inner housing to move axially only forward with respect to the outer housing.

5

18. An injection device as claimed in claim 17 wherein said means is an arrangement of serrations, barbs, ratchet teeth or the like intermediate the housings.

10

19. An injection device as claimed in any of the preceding claims further comprising guide means for guiding, in use, the relative axial movement of the spring and outer housings, the guide means preferably comprising one or more protrusions on said spring housing which, in use, cooperate with corresponding recesses on an interior surface of said outer housing.

20. An injection device as claimed in any of the preceding claims wherein said needle is biased to be normally wholly inside said housing by means of a spring intermediate the barrel and the outer and/or spring housing.

25. An injection device as claimed in any of the preceding claims wherein the needle is removable from said device.

30. An injection device as claimed in any of the preceding claims wherein said needle, barrel and plunger are removable from said device.

35. An injection device as claimed in any of the preceding claims further including a removable needle cover which protects the needle during storage before use.

24. An injection device as claimed in claim 23 wherein said needle cover includes means for pulling a protective rubber sheath or the like from said needle when said needle cover is removed from the device.

5

25. An injection device as claimed in claim 24 wherein said pulling means includes a floating rivet intermediate the needle cover and the protective rubber sheath or the like, whereby twisting forces applied to said needle cover are substantially prevented from being transmitted to said rubber sheath or the like.

10

26. An injection device as claimed in any of claims 23-25 wherein the presence of said needle cover on said device serves as a safety lock, substantially preventing relative forward movement of said outer housing.

15

27. An injection device as claimed in any of the preceding claims further comprising a viewing window in said barrel aligned with a viewing window in said outer housing such that said medicament can be viewed by a user prior to an injection taking place.

20

28. An injection device as claimed in claim 27 wherein, in use during an injection, said inner housing moves intermediate said viewing window in the outer housing and said barrel so as to obscure the window in the barrel from the user's view.

25

29. An injection device as claimed in any of the preceding claims further comprising means for emitting an audible and/or physical indication to a user that the injection is complete.

30

35

the plunger.

An alternative way of concealing the needle after an injection has been delivered is described in US6544234 (BD Medico SARL), which discloses an injection device in which the needle is concealed before injection, but the configuration of the device is such that the needle cannot retract after injection. Instead, there is a moveable needle protection sleeve which is displaced by a compression spring when the needle is pulled out of the subcutaneous tissue in order to conceal the needle from the patient.

WO03/097133 (Owen Mumford) discloses an injection device with a retractable needle but with driving force applied to the liquid inside the syringe, using the liquid's incompressible nature to cause the needle to move forward. A relatively complex arrangement is required for this and it would be desirable to provide an injection device wherein the forward driving force is applied to the syringe, not to the liquid drug therein.

Although the present invention may relate to mini-needle or jet injection devices, the invention is equally applicable to other types of injection device, for example those for deep-penetrating muscular injection as well as those which are for shallower, subcutaneous, injection.

According to a first aspect of the present invention there is provided an injection device comprising an outer housing ~~inside which is located~~ adapted to receive a barrel for holding a volume of a medicament; a needle at one end of the barrel, the needle and barrel being such that at least part of the needle is

| such that, in use, the plunger and barrel are able to retract in order to retract the needle into the outer housing.

5 The injection device according to the present invention provides a simple and cost-effective means of delivering medicament through a retractable needle. If desired, the device is able to deliver medicament to a depth beyond the length of the needle because of the propulsive force  
10 provided by the energy source. As mentioned above, the injection device is equally suitable for needle-assisted jet injection (delivering medicament to a depth beyond the length of the needle), conventional injection (to the depth of the needle penetration), or even to a user-  
15 adjustable needle penetration depth.

The device requires that the needle (and hence also the barrel to which it is normally fixed) is moved axially so that the needle can appear beyond the end of the nozzle  
20 for the duration of the injection, after which the needle retracts automatically, out of sight of the user. The device also requires that the plunger is moved axially (into the barrel) so that medicament is ejected. The overall complexity of the injection device is  
25 significantly reduced by both of these requirements being effected by one component, namely the inner housing.

30 | Preferably, the injection device comprises an outer housing inside which is located said barrel, said needle and said plunger.

Preferably, said inner housing includes one or more radially flexible tags, each preferably located at the end of a resiliently flexible leg.

forces applied to said needle cover are substantially prevented from being transmitted to said rubber sheath or the like.

5 Preferably, the presence of said needle cover on said device serves as a safety lock, substantially preventing relative forward movement of said outer housing.

In a preferred form, the injection device further 10 comprises a viewing window in said barrel aligned with a viewing window in said outer housing such that said medicament can be viewed by a user prior to an injection taking place. Preferably, in use during an injection, said inner housing moves intermediate said viewing window 15 in the outer housing and said barrel so as to obscure the window in the barrel from the user's view.

Preferably, the injection device includes means for emitting an audible and/or physical indication to a user 20 that the injection is complete.

~~According to a second aspect of the invention there is provided an injection device comprising an outer housing inside which is located~~

25 ~~a barrel for holding a volume of a medicament; a needle at one end of the barrel, the needle and barrel being such that at least part of the needle is axially moveable in and out of said outer housing but is biased to be normally wholly inside said housing;~~

30 ~~a plunger, axially moveable within the barrel, an inner housing intermediate the outer housing and the barrel and plunger; and an energy source in communication with said inner housing,~~

wherein the inner housing is moveable by the energy source between two positions, namely

5 a first position in which the inner housing is in communication with the plunger but not the barrel such that, in use, said plunger is moveable axially into said barrel so as to expel medicament through the needle; and

10 a second position in which the inner housing is in communication with neither the plunger nor the barrel such that, in use, the plunger and barrel are able to retract in order to retract the needle into the outer housing.

15 According to a third aspect of the invention there is provided an injection device comprising an outer housing adapted to receive:

20 a barrel for holding a volume of a medicament, a needle at one end of the barrel, the needle and barrel being such that at least part of the needle is axially moveable in and out of said outer housing but is biased to be normally wholly inside said housing; and

25 a plunger, axially moveable within the barrel, characterised in that the injection device further comprises:

30 an inner housing intermediate the outer housing and the barrel and plunger; and

35 an energy source in communication with said inner housing,

wherein the inner housing is moveable by the energy source between three positions, namely

a first position in which the inner housing is in communication with both the plunger and the barrel such that, in use, the plunger and barrel are moveable axially so as to move at least part of said needle out of the outer housing;

5 a second position in which the inner housing is in communication with the plunger but not the barrel such that, in use, said plunger is movable axially into said barrel so as to expel medicament through the needle; and  
10 a third position in which the inner housing is in communication with neither the plunger nor the barrel such that, in use, the plunger and barrel are able to retract in order to retract the needle into the outer housing.

15 Preferred embodiments of the present invention will now be more particularly described, by way of example only, with reference to the accompanying drawings wherein:

20 Figure 1 is a perspective view, partly in section, showing the injection device, in the condition in which it is supplied to a user, apart from the needle cover;

25 Figure 2, drawn to a larger scale, shows detail of part of the device shown in Figure 1;

30 Figure 3 is a perspective view, partly in section, showing the injection device, during an injection;

Figure 4, drawn to a larger scale, shows detail of part of the device shown in Figure 3;

35 Figure 5 is a perspective view, partly in section, showing the injection device, with the plunger fully depressed into the barrel;

Figure 6, drawn to a larger scale, shows detail of part of the device shown in Figure 5;

35 | Figure 7 is a perspective view, partly in section,

## CLAIMS

1.30. An injection device comprising an outer housing (30) - adapted to receive:

5 a barrel for holding a volume of a medicament;  
a needle (10) at one end of the barrel, the  
needle and barrel being such that at least part of  
the needle is axially moveable in and out of said  
outer housing (30) but is biased to be normally  
10 wholly inside said housing; and  
a plunger (8), axially moveable within the  
barrel,

wherein the injection device further comprises:  
15 an inner housing (7) intermediate the outer  
housing and the barrel and plunger; and  
an energy source (1; 40) in communication with  
said inner housing (7),  
characterised in that the inner housing (7) is  
moveable by the energy source between three positions,  
20 namely

a first position in which the inner housing has  
one or more radially flexible tags (7B) in communication  
with the barrel such that, in use, the plunger and barrel  
are movable axially so as to move at least part of said  
needle out of the outer housing;

25 a second position in which the inner housing  
has one or more radially flexible tags (7A) in  
communication with the plunger but not the barrel such  
that, in use, said plunger is movable axially into said  
barrel so as to expel medicament through the needle; and  
30 a third position in which said radially flexible tags  
(7A, 7B) on the inner housing are in communication with  
neither the plunger nor the barrel such that, in use, the  
plunger and barrel are able to retract in order to  
35 retract the needle into the outer housing.

1.2. An The injection device comprising an outer housing (30) of claim 1 inside which is located  
a said barrel for holding a volume of a medicament;

5 a said needle (10) at one end of the barrel;  
the needle and barrel being such that at least part of the needle is axially moveable in and out of said outer housing (30) but is biased to be normally wholly inside said housing, and

10 a said plunger (8), axially moveable within the  
barrel.

an inner housing (7) intermediate the outer housing and the barrel and plunger, and  
an energy source (1, 40) in communication with  
15 said inner housing (7),

characterised in that the inner housing (7) is moveable by the energy source between three positions, namely

20 a first position in which the inner housing has one or more radially flexible tags (7B) which are in communication with the barrel such that, in use, the plunger and barrel are movable axially so as to move at least part of said needle out of the outer housing,

25 a second position in which the inner housing has one or more radially flexible tags (7A) which are in communication with the plunger but not the barrel such that, in use, said plunger is movable axially into said barrel so as to expel medicament through the needle, and

30 a third position in which said one or more radially flexible tags (7A, 7B) on the inner housing are in communication with neither the plunger nor the barrel such that, in use, the plunger and barrel are able to retract in order to retract the needle into the outer housing.

2.3. An injection device as claimed in claim 1  
or claim 2 further comprising a spring housing (41)  
intermediate the outer housing (30) and the inner housing  
5 (7).

10 3.4. An injection device as claimed in any of  
the preceding claims wherein one or more of said tags  
is located at the end of a resiliently flexible leg.

15 4.5. An injection device as claimed in any of  
the preceding claims wherein one or more of said tags are  
situated at the rear end of the inner housing and are  
moveable radially into and out of communication with the  
plunger.

20 5.6. An injection device as claimed in any of  
claims 2-43-5 wherein said tags are biased radially  
inwardly into communication with said plunger, preferably  
by communication with said spring housing.

25 6.7. An injection device as claimed in any of  
the preceding claims wherein said tags are stored in  
their relaxed condition, before initiating an injection.

30 7.8. An injection device as claimed in any of  
claims 2-63-7 wherein each rear tag is moveable out of  
communication with the plunger when aligned with a  
corresponding recess in the spring housing.

35 8.9. An injection device as claimed in any of  
the preceding claims wherein each rear tag is  
substantially T-shaped.

9.10. An injection device as claimed in any of claims  
1-43

wherein one or more of said tags are situated at the forward end of the inner housing and are moveable radially into and out of communication with the barrel.

5 | 10.11. —An injection device as claimed in claim 9-10 wherein said forward tags are biased radially inwardly into communication with said barrel, preferably by communication with said spring housing.

10 | 11.12. —An injection device as claimed in claim 9-10 or claim 110 wherein said forward tags are stored in their relaxed condition, before initiating an injection.

15 | 12.13. —An injection device as claimed in any of claims 9-110-12 wherein each forward tag is moveable out of communication with the barrel when aligned with a corresponding recess in the spring housing.

20 | 13.14. —An injection device as claimed in any of claims 9-1210-13 wherein each forward tag is substantially L-shaped.

25 | 14.15. An injection device as claimed in any of the preceding claims wherein said energy source is a compressed gas.

15.16. An injection device as claimed in any of claims 1-13-14 wherein said energy source is a spring.

30 | 16.17. —An injection device as claimed in any of the preceding claims further including means for allowing the inner housing to move axially only forward with respect to the outer housing

1718. — An injection device as claimed in claim 1617 wherein said means is an arrangement of serrations, 5 barbs, ratchet teeth or the like intermediate the housings.

18.19. —An injection device as claimed in any of the preceding claims further comprising guide means for 10 guiding, in use, the relative axial movement of the spring and outer housings, the guide means preferably comprising one or more protrusions on said spring housing which, in use, cooperate with corresponding recesses on an interior surface of said outer housing.

15 19.20. —An injection device as claimed in any of the preceding claims wherein said needle is biased to be normally wholly inside said housing by means of a spring intermediate the barrel and the outer and/or spring 20 housing.

25 20.21. —An injection device as claimed in any of the preceding claims wherein the needle is removable from said device.

21.22. —An injection device as claimed in any of the preceding claims wherein said needle, barrel and plunger are removable from said device.

30 22.23. —An injection device as claimed in any of the preceding claims further including a removable needle cover which protects the needle during storage before use.

35 23.24. —An injection device as claimed in claim 223 wherein said needle cover includes means for pulling a

protective rubber sheath or the like from said needle when said needle cover is removed from the device.

5      24-25. —An injection device as claimed in claim ~~23-24~~ wherein said pulling means includes a floating rivet intermediate the needle cover and the protective rubber sheath or the like, whereby twisting forces applied to said needle cover are substantially prevented from being transmitted to said rubber sheath or the like.

10      25-26. —An injection device as claimed in any of claims ~~22-23-24-25~~ wherein the presence of said needle cover on said device serves as a safety lock, substantially preventing relative forward movement of 15 said outer housing.

20      26-27. An injection device as claimed in any of the preceding claims further comprising a viewing window in said barrel aligned with a viewing window in said outer housing such that said medicament can be viewed by a user prior to an injection taking place.

25      27-28. —An injection device as claimed in claim ~~26-27~~ wherein, in use during an injection, said inner housing moves intermediate said viewing window in the outer housing and said barrel so as to obscure the window in the barrel from the user's view.

30      28-29. —An injection device as claimed in any of the preceding claims further comprising means for emitting an audible and/or physical indication to a user that the injection is complete.

29. An injection device comprising an outer housing inside which is located

5 a barrel for holding a volume of a medicament, a needle at one end of the barrel, the needle and barrel being such that at least part of the needle is axially moveable in and out of said outer housing but is biased to be normally wholly inside said housing;

10 a plunger, axially moveable within the barrel; an inner housing intermediate the outer housing and the barrel and plunger; and an energy source in communication with said inner housing,

15 characterised in that the inner housing is moveable by the energy source between two positions, namely a first position in which the inner housing has one or more radially flexible tags which are in communication with the plunger but not the barrel such that, in use, said plunger is movable axially into said barrel so as to expel medicament through the needle; and

20 a second position in which said one or more radially flexible tags on the inner housing are in communication with neither the plunger nor the barrel such that, in use, the plunger and barrel are able to

25 retract in order to retract the needle into the outer housing.

30 30. An injection device comprising an outer housing adapted to receive:

35 a barrel for holding a volume of a medicament; a needle at one end of the barrel, the needle and barrel being such that at least part of the needle is axially moveable in and out of said outer housing but is biased to be normally wholly inside said housing; and

~~a plunger, axially moveable within the barrel,~~  
~~wherein the injection device further comprises.~~

5 ~~an inner housing intermediate the outer housing and the barrel and plunger; and~~

~~an energy source in communication with said inner housing,~~

~~characterised in that the inner housing is moveable by the energy source between three positions, namely~~

10 ~~a first position in which the inner housing has one or more radially flexible tags in communication with the barrel such that, in use, the plunger and barrel are movable axially so as to move at least part of said needle out of the outer housing;~~

15 ~~a second position in which the inner housing has one or more radially flexible tags in communication with the plunger but not the barrel such that, in use, said plunger is movable axially into said barrel so as to expel medicament through the needle; and~~

20 ~~a third position in which said radially flexible tags on the inner housing are in communication with neither the plunger nor the barrel such that, in use, the plunger and barrel are able to retract in order to retract the needle into the outer housing.~~

25 ~~31. An injection device as claimed in claim 29 or claim 30 having all of the features of any of claims 2-28.~~

Dear Sirs

**European Patent Application No 05701985.3**  
**Auto Safety Injector**  
**The Medical House plc**

We are writing in response to your communication pursuant to Article 96(2) EPC dated 30 October 2006. A PACE Request was filed 27.09.2006 and we respectfully request that this response is handled as quickly as possible.

With this letter we are filing the following replacement pages, amended in light of the examiner's comments:

**Description:** pages 2-7 (previous page 8 should be removed and the remaining pages renumbered accordingly)  
**Claims:** Claims 1-29

A further copy of the relevant pages is enclosed on which the amendments have been indicated for the examiner's reference.

#### Clarity – Article 84 EPC

The examiner objected to the three independent claims 1, 29 and 30. Whilst the applicant does not believe there to be a lack of clarity, in the interest of expedient prosecution, claim 29 has been deleted. Claim 30 has been recast as the main claim, with former claim 1 dependent thereon, so that there now is only one independent claim in this application. Basis for making claim 30 be the main claim with the other claims dependent thereon is found in former claim 31, which has also now been deleted.

### Other Matters

The paragraph numbering below corresponds with the paragraph numbering in the examiner's communication.

3. Reference signs in parentheses have been added to new claim 1 (former claim 30).
4. Former claim 1 was indeed already in two-part form, but this issue is no longer relevant given the amendment to this claim, which is now dependent claim 2. New claim 1 (former claim 30) is also already in two-part form.
5. Document D1 was already identified and discussed on page 2 of the description filed upon entry into the European regional phase. Document D2 is identified and discussed on replacement page 2 filed herewith. D2, namely WO03/097133 (Owen Mumford) discloses an injection device with a retractable needle but with the driving force applied to the liquid inside the syringe; using the liquid's incompressible nature to cause the needle to move forward. A relatively complex arrangement is required for this and it is desirable to provide an injection device wherein the forward driving force is applied to the syringe, not to the liquid drug therein.
6. As already identified by the examiner, there is a critical difference between the D1 and D2 devices. The D1 device applies driving force to the flange of the syringe barrel in order to move the needle forward, ready for injection. In contrast, the D2 device applies driving force to the liquid drug itself inside the syringe, using its incompressible nature to cause the needle to move forward, ready for injection. These two different types of technology are incompatible with one another.

Regarding inventive step, the closest prior art appears to be D1. Taking this as a starting point, the technical problem to be solved is how to provide an injection device wherein the needle automatically retracts into the housing after injection.

Starting with the teaching of the D1, and assuming the skilled person wanted to modify the D1 device so that its needle could retract after the injection, there is no reason why the skilled reader would look to the teaching of D2 to supply the missing feature, given the significant technical differences between the D1 and D2 devices.

Even if the skilled person tried to combine the teachings of D1 and D2 in order to make the D1 device have a retractable needle, D2 would lead him to modify the pressure plate 26 and end 112 of the ejection member of D1 into an arrangement equivalent to the rod end 27A and aperture in the drive member 8 of D2, so that the "retractable" D1 device would be of the type which applies driving force to the liquid drug inside the syringe i.e. leading further away from the invention claimed in the present application.

In other words, either the device acts on the barrel to move the needle forward (as in D1), in which case the needle cannot retract, or the device acts on the liquid drug to move the needle forward (as in D2), in which case the needle can retract but the inner housing is never "intermediate the outer housing and the barrel and plunger" as required by claim 1.

It is therefore clear that the claimed invention is not obvious in light of D1 and D2.

10. NOV. 2006 12:50

HARRISON GODDARD FOO

NO. 529 P. 3

7. The description has been brought into conformity with the amended claims on replacement pages 2-8 filed herewith.

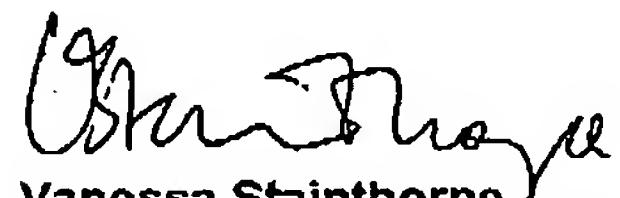

The deletion of any subject matter from the present application should not be construed as abandonment of that subject matter and is not without prejudice to its reinstatement or to filing a divisional application for that subject matter.

The examiner is invited to contact the undersigned if any point remains outstanding that can be usefully resolved by telephone.

Oral proceedings are requested if the examiner contemplates refusing the application.

I enclose two copies of EPO Form 1037, and I should be grateful if you would stamp and return one of these to us immediately as an acknowledgement of receipt of this letter and enclosures.

Yours faithfully

the plunger.

An alternative way of concealing the needle after an injection has been delivered is described in US6544234 5 (BD Medico SARL), which discloses an injection device in which the needle is concealed before injection, but the configuration of the device is such that the needle cannot retract after injection. Instead, there is a moveable needle protection sleeve which is displaced by a 10 compression spring when the needle is pulled out of the subcutaneous tissue in order to conceal the needle from the patient.

15 WO03/097133 (Owen Mumford) discloses an injection device with a retractable needle but with driving force applied to the liquid inside the syringe, using the liquid's incompressible nature to cause the needle to move forward. A relatively complex arrangement is required for this and it would be desirable to provide an injection device wherein the forward driving force is applied to the syringe, not to the liquid drug therein.  
20

Although the present invention may relate to mini-needle or jet injection devices, the invention is equally 25 applicable to other types of injection device, for example those for deep-penetrating muscular injection as well as those which are for shallower, subcutaneous, injection.

30 According to a first aspect of the present invention there is provided an injection device comprising an outer housing inside which is located adapted to receive a barrel for holding a volume of a medicament; a needle at one end of the barrel, the needle and 35 barrel being such that at least part of the needle is

| such that, in use, the plunger and barrel are able to retract in order to retract the needle into the outer housing.

5 The injection device according to the present invention provides a simple and cost-effective means of delivering medicament through a retractable needle. If desired, the device is able to deliver medicament to a depth beyond the length of the needle because of the propulsive force  
10 provided by the energy source. As mentioned above, the injection device is equally suitable for needle-assisted jet injection (delivering medicament to a depth beyond the length of the needle), conventional injection (to the depth of the needle penetration), or even to a user-  
15 adjustable needle penetration depth.

The device requires that the needle (and hence also the barrel to which it is normally fixed) is moved axially so that the needle can appear beyond the end of the nozzle  
20 for the duration of the injection, after which the needle retracts automatically, out of sight of the user. The device also requires that the plunger is moved axially (into the barrel) so that medicament is ejected. The overall complexity of the injection device is  
25 significantly reduced by both of these requirements being effected by one component, namely the inner housing.

30 Preferably, the injection device comprises an outer housing inside which is located said barrel, said needle and said plunger.

Preferably, said inner housing includes one or more radially flexible tags, each preferably located at the end of a resiliently flexible leg.

forces applied to said needle cover are substantially prevented from being transmitted to said rubber sheath or the like.

5 Preferably, the presence of said needle cover on said device serves as a safety lock, substantially preventing relative forward movement of said outer housing.

10 In a preferred form, the injection device further comprises a viewing window in said barrel aligned with a viewing window in said outer housing such that said medicament can be viewed by a user prior to an injection taking place. Preferably, in use during an injection, said inner housing moves intermediate said viewing window 15 in the outer housing and said barrel so as to obscure the window in the barrel from the user's view.

20 Preferably, the injection device includes means for emitting an audible and/or physical indication to a user that the injection is complete.

According to a second aspect of the invention there is provided an injection device comprising an outer housing inside which is located

25 a barrel for holding a volume of a medicament, a needle at one end of the barrel, the needle and barrel being such that at least part of the needle is axially moveable in and out of said outer housing but is biased to be normally wholly inside said housing;

30 a plunger, axially moveable within the barrel, an inner housing intermediate the outer housing and the barrel and plunger, and an energy source in communication with said inner housing,

35

wherein the inner housing is moveable by the energy source between two positions, namely

5 a first position in which the inner housing is in communication with the plunger but not the barrel such that, in use, said plunger is movable axially into said barrel so as to expel medicament through the needle, and

10 a second position in which the inner housing is in communication with neither the plunger nor the barrel such that, in use, the plunger and barrel are able to retract in order to retract the needle into the outer housing.

According to a third aspect of the invention there is provided an injection device comprising an outer housing adapted to receive:

20 a barrel for holding a volume of a medicament, a needle at one end of the barrel, the needle and barrel being such that at least part of the needle is axially moveable in and out of said outer housing but is biased to be normally wholly inside said housing; and

25 a plunger, axially moveable within the barrel, characterised in that the injection device further comprises:

30 an inner housing intermediate the outer housing and the barrel and plunger; and

35 an energy source in communication with said inner housing, wherein the inner housing is moveable by the energy source between three positions, namely

a first position in which the inner housing is in communication with both the plunger and the barrel such that, in use, the plunger and barrel are movable axially so as to move at least part of said needle out of the outer housing,

5            a second position in which the inner housing is in communication with the plunger but not the barrel such that, in use, said plunger is movable axially into said barrel so as to expel medicament through the needle; and  
10            a third position in which the inner housing is in communication with neither the plunger nor the barrel such that, in use, the plunger and barrel are able to retract in order to retract the needle into the outer housing.

15           Preferred embodiments of the present invention will now be more particularly described, by way of example only, with reference to the accompanying drawings wherein:

20           15      Figure 1 is a perspective view, partly in section, showing the injection device, in the condition in which it is supplied to a user, apart from the needle cover;

25           20      Figure 2, drawn to a larger scale, shows detail of part of the device shown in Figure 1;

30           25      Figure 3 is a perspective view, partly in section, showing the injection device, during an injection;

35           30      Figure 4, drawn to a larger scale, shows detail of part of the device shown in Figure 3;

40           35      Figure 5 is a perspective view, partly in section, showing the injection device, with the plunger fully depressed into the barrel;

45           40      Figure 6, drawn to a larger scale, shows detail of part of the device shown in Figure 5;

50           45      35      Figure 7 is a perspective view, partly in section,

## CLAIMS

2

1. 30. An injection device comprising an outer housing (30) - adapted to receive:

5

a barrel for holding a volume of a medicament;

10

a needle (10) at one end of the barrel, the needle and barrel being such that at least part of the needle is axially moveable in and out of said outer housing (30) but is biased to be normally wholly inside said housing; and

a plunger (8), axially moveable within the barrel,

15

wherein the injection device further comprises:

an inner housing (7) intermediate the outer housing and the barrel and plunger; and

20

an energy source (1; 40) in communication with said inner housing (7),

characterised in that the inner housing (7) is moveable by the energy source between three positions, namely

25

a first position in which the inner housing has one or more radially flexible tags (7B) in communication with the barrel such that, in use, the plunger and barrel are movable axially so as to move at least part of said needle out of the outer housing;

30

a second position in which the inner housing has one or more radially flexible tags (7A) in communication with the plunger but not the barrel such that, in use, said plunger is movable axially into said barrel so as to expel medicament through the needle; and a third position in which said radially flexible tags (7A, 7B) on the inner housing are in communication with neither the plunger nor the barrel such that, in use, the plunger and barrel are able to retract in order to retract the needle into the outer housing.

3

1.2. An The injection device comprising an outer housing (30) of claim 1 inside which is located

5 a said barrel for holding a volume of a medicament;

10 a said needle (10) at one end of the barrel, the needle and barrel being such that at least part of the needle is axially moveable in and out of said outer housing (30) but is biased to be normally wholly inside said housing, and

15 a said plunger (8), axially moveable within the barrel.

20 an inner housing (7) intermediate the outer housing and the barrel and plunger, and

25 an energy source (1, 10) in communication with said inner housing (7), characterised in that the inner housing (7) is moveable by the energy source between three positions, namely

30 a first position in which the inner housing has one or more radially flexible tags (7B) which are in communication with the barrel such that, in use, the plunger and barrel are movable axially so as to move at least part of said needle out of the outer housing;

a second position in which the inner housing has one or more radially flexible tags (7A) which are in communication with the plunger but not the barrel such that, in use, said plunger is movable axially into said barrel so as to expel medicament through the needle; and

35 a third position in which said one or more radially flexible tags (7A, 7B) on the inner housing are in communication with neither the plunger nor the barrel such that, in use, the plunger and barrel are able to retract in order to retract the needle into the outer housing.

2.3. An injection device as claimed in claim 1 or claim 2 further comprising a spring housing (41) intermediate the outer housing (30) and the inner housing 5 (7).

3.4. An injection device as claimed in any of the preceding claims— wherein one or more of said tags is located at the end of a resiliently flexible leg.

10

4.5. An injection device as claimed in any of the preceding claims wherein one or more of said tags are situated at the rear end of the inner housing and are moveable radially into and out of communication with the 15 plunger.

5.6. An injection device as claimed in any of claims 2-43-5 wherein said tags are biased radially inwardly into communication with said plunger, preferably 20 by communication with said spring housing.

6.7. An injection device as claimed in any of the preceding claims wherein said tags are stored in their relaxed condition, before initiating an injection.

25

7.8. An injection device as claimed in any of claims 2-63-7 wherein each rear tag is moveable out of communication with the plunger when aligned with a corresponding recess in the spring housing.

30

8.9. An injection device as claimed in any of the preceding claims wherein each rear tag is substantially T-shaped.

35 9.10. An injection device as claimed in any of claims 1-43

5

wherein one or more of said tags are situated at the forward end of the inner housing and are moveable radially into and out of communication with the barrel.

5 | 10-11. —An injection device as claimed in claim 9-10 wherein said forward tags are biased radially inwardly into communication with said barrel, preferably by communication with said spring housing.

10 | 11-12. —An injection device as claimed in claim 9-10 or claim 11 wherein said forward tags are stored in their relaxed condition, before initiating an injection.

15 | 12-13. —An injection device as claimed in any of claims 9-11-10-12 wherein each forward tag is moveable out of communication with the barrel when aligned with a corresponding recess in the spring housing.

20 | 13-14. —An injection device as claimed in any of claims 9-12-10-13 wherein each forward tag is substantially L-shaped.

25 | 14-15. An injection device as claimed in any of the preceding claims wherein said energy source is a compressed gas.

15-16. An injection device as claimed in any of claims 1-13-14 wherein said energy source is a spring.

30 | 16-17. —An injection device as claimed in any of the preceding claims further including means for allowing the inner housing to move axially only forward with respect to the outer housing

17.18. — An injection device as claimed in claim 16.17 wherein said means is an arrangement of serrations, 5 barbs, ratchet teeth or the like intermediate the housings.

18.19. — An injection device as claimed in any of the preceding claims further comprising guide means for 10 guiding, in use, the relative axial movement of the spring and outer housings, the guide means preferably comprising one or more protrusions on said spring housing which, in use, cooperate with corresponding recesses on an interior surface of said outer housing.

19.20. — An injection device as claimed in any of the preceding claims wherein said needle is biased to be normally wholly inside said housing by means of a spring intermediate the barrel and the outer and/or spring 20 housing.

20.21. — An injection device as claimed in any of the preceding claims wherein the needle is removable from said device.

21.22. — An injection device as claimed in any of the preceding claims wherein said needle, barrel and plunger are removable from said device.

22.23. — An injection device as claimed in any of the preceding claims further including a removable needle cover which protects the needle during storage before use.

23.24. — An injection device as claimed in claim 22.3 wherein said needle cover includes means for pulling a

7

protective rubber sheath or the like from said needle when said needle cover is removed from the device.

5      | 24.25. —An injection device as claimed in claim 23-24 wherein said pulling means includes a floating rivet intermediate the needle cover and the protective rubber sheath or the like, whereby twisting forces applied to said needle cover are substantially prevented from being transmitted to said rubber sheath or the like.

10

15     | 25.26. —An injection device as claimed in any of claims 2223-24-25 wherein the presence of said needle cover on said device serves as a safety lock, substantially preventing relative forward movement of said outer housing.

20     | 26.27. An injection device as claimed in any of the preceding claims further comprising a viewing window in said barrel aligned with a viewing window in said outer housing such that said medicament can be viewed by a user prior to an injection taking place.

25     | 27.28. —An injection device as claimed in claim 26-27 wherein, in use during an injection, said inner housing moves intermediate said viewing window in the outer housing and said barrel so as to obscure the window in the barrel from the user's view.

30     | 28.29. —An injection device as claimed in any of the preceding claims further comprising means for emitting an audible and/or physical indication to a user that the injection is complete.

29. An ~~injection device comprising an outer housing inside which is located~~

5

~~a barrel for holding a volume of a medicament, a needle at one end of the barrel, the needle and barrel being such that at least part of the needle is axially moveable in and out of said outer housing but is biased to be normally wholly inside said housing,~~

10

~~a plunger, axially moveable within the barrel, an inner housing intermediate the outer housing and the barrel and plunger, and an energy source in communication with said inner housing,~~

15

~~characterised in that the inner housing is moveable by the energy source between two positions, namely~~

20

~~a first position in which the inner housing has one or more radially flexible tags which are in communication with the plunger but not the barrel such that, in use, said plunger is movable axially into said barrel so as to expel medicament through the needle; and~~

25

~~a second position in which said one or more radially flexible tags on the inner housing are in communication with neither the plunger nor the barrel such that, in use, the plunger and barrel are able to retract in order to retract the needle into the outer housing.~~

30

30. An ~~injection device comprising an outer housing adapted to receive~~

35

~~a barrel for holding a volume of a medicament, a needle at one end of the barrel, the needle and barrel being such that at least part of the needle is axially moveable in and out of said outer housing but is biased to be normally wholly inside said housing, and~~

3033

a plunger, axially moveable within the barrel,  
wherein the injection device further comprises,  
5 an inner housing intermediate the outer housing  
and the barrel and plunger, and  
an energy source in communication with said  
inner housing,  
characterised in that the inner housing is moveable  
by the energy source between three positions, namely  
10 a first position in which the inner housing has  
one or more radially flexible tags in communication with  
the barrel such that, in use, the plunger and barrel are  
moveable axially so as to move at least part of said  
needle out of the outer housing,  
15 a second position in which the inner housing  
has one or more radially flexible tags in communication  
with the plunger but not the barrel such that, in use,  
said plunger is moveable axially into said barrel so as to  
expel medicament through the needle; and  
20 a third position in which said radially  
flexible tags on the inner housing are in communication  
with neither the plunger nor the barrel such that, in  
use, the plunger and barrel are able to retract in order  
to retract the needle into the outer housing.  
25  
31. An injection device as claimed in claim 29 or  
claim 30 having all of the features of any of claims  
2-28.  
30

## INJECTION DEVICE

This invention relates to the field of injection devices for the administration of liquid medication, for example, 5 insulin or growth hormone.

One type of injection device is known as a mini-needle or micro-needle device. These devices comprise a pressurised ("forced") injection system and have a needle which is 10 shorter than that of conventional needle systems. The needle is normally hidden which is advantageous both for avoiding needle stick injuries and for minimising trauma to needle-phobic patients. The needle is hidden both before and after the injection is delivered, appearing 15 only for the duration of the injection. Mini needle devices can typically deliver a larger volume of medication than needle-free devices and can deliver faster than conventional needle systems.

20 One such known device is described in WO00/09186 (Medi-Ject Corporation) for "Needle assisted jet injector" and this document gives a useful summary of prior art devices.

25 The device of WO 00/09186 includes a needle which is, in one embodiment, retractably located within an injector nozzle assembly. Upon activation of a force generating source, a portion of the needle extends past the nozzle assembly and penetrates the outer layer of skin to 30 deliver medicament via jet injection to a deeper region. After activation, the needle retracts back into the nozzle assembly. The retractable needle is housed within the nozzle and is pushed forward so that it emerges in order to deliver an injection by the liquid medicament 35 itself, when the medicament is itself pushed forward by the plunger.

An alternative way of concealing the needle after an injection has been delivered is described in US6544234 (BD Medico SARL), which discloses an injection device in 5 which the needle is concealed before injection, but the configuration of the device is such that the needle cannot retract after injection. Instead, there is a moveable needle protection sleeve which is displaced by a compression spring when the needle is pulled out of the 10 subcutaneous tissue in order to conceal the needle from the patient.

WO03/097133 (Owen Mumford) discloses an injection device with a retractable needle but with driving force applied 15 to the liquid inside the syringe, using the liquid's incompressible nature to cause the needle to move forward. A relatively complex arrangement is required for this and it would be desirable to provide an injection device wherein the forward driving force is 20 applied to the syringe, not to the liquid drug therein.

Although the present invention may relate to mini-needle or jet injection devices, the invention is equally applicable to other types of injection device, for 25 example those for deep-penetrating muscular injection as well as those which are for shallower, subcutaneous, injection.

According to a first aspect of the present invention 30 there is provided an injection device comprising an outer housing adapted to receive

a barrel for holding a volume of a medicament;  
a needle at one end of the barrel, the needle and barrel being such that at least part of the needle is 35 axially moveable in and out of said outer housing but is biased to be normally wholly inside said housing;

3

a plunger, axially moveable within the barrel;  
an inner housing intermediate the outer housing and  
the barrel and plunger; and

5 an energy source in communication with said inner  
housing,

wherein the inner housing is moveable by the energy  
source between three positions, namely

10 a first position in which the inner housing is in  
communication with both the plunger and the barrel such  
that, in use, the plunger and barrel are movable axially  
so as to move at least part of said needle out of the  
outer housing;

15 a second position in which the inner housing is in  
communication with the plunger but not the barrel such  
that, in use, said plunger is movable axially into said  
barrel so as to expel medicament through the needle; and

20 a third position in which the inner housing is in  
communication with neither the plunger nor the barrel  
such that, in use, the plunger and barrel are able to  
retract in order to retract the needle into the outer  
housing.

The injection device according to the present invention  
provides a simple and cost-effective means of delivering  
25 medicament through a retractable needle. If desired, the  
device is able to deliver medicament to a depth beyond  
the length of the needle because of the propulsive force  
provided by the energy source. As mentioned above, the  
injection device is equally suitable for needle-assisted  
30 jet injection (delivering medicament to a depth beyond  
the length of the needle), conventional injection (to the  
depth of the needle penetration), or even to a user-  
adjustable needle penetration depth.

35 The device requires that the needle (and hence also the  
barrel to which it is normally fixed) is moved axially so

4

that the needle can appear beyond the end of the nozzle for the duration of the injection, after which the needle retracts automatically, out of sight of the user. The device also requires that the plunger is moved axially 5 (into the barrel) so that medicament is ejected. The overall complexity of the injection device is significantly reduced by both of these requirements being effected by one component, namely the inner housing.

10 Preferably, the injection device comprises an outer housing inside which is located said barrel, said needle and said plunger.

15 Preferably, said inner housing includes one or more radially flexible tags, each preferably located at the end of a resiliently flexible leg.

20 Preferably, one or more of said tags are situated at the rear end of the inner housing and are moveable radially into and out of communication with the plunger. In one embodiment, the tags are biased radially inwardly into communication with the plunger, preferably by communication with the outer housing. Alternatively, the tags are stored in their relaxed condition, before an 25 injection is initiated.

30 Each rear tag may be moveable out of communication with the plunger when aligned with a corresponding recess in the outer housing. Preferably, each rear tag is substantially T-shaped. One leg of the T-shape enables the rear tag to hook over the plunger and, effectively, pull the plunger forward (in the first and second positions mentioned above). The other leg of the T-shape enables the rear tag to move radially outwardly to catch 35 in a recess in the housing (in the third position mentioned above).

Preferably, one or more of said tags are situated at the forward end of the inner housing and are moveable radially into and out of communication with the barrel.

5 In one embodiment, the forward tags are biased radially inwardly into communication with the barrel, preferably by communication with the outer housing. Alternatively, the forward tags are stored in their relaxed condition, before initiating an injection.

10

Each forward tag may be moveable out of communication with the barrel when aligned with a corresponding recess in the outer housing. Preferably, each rear tag is substantially L-shaped.

15

In a preferred embodiment, said energy source is a compressed gas. Alternatively, said energy source is a spring.

20 Preferably, the injection device further includes means for allowing the inner housing to move axially only forward with respect to the outer housing. Ideally, said means is an arrangement of serrations, barbs, ratchet teeth or the like intermediate the housings.

25

Preferably, the injection device further comprises guide means for guiding, in use, the relative axial movement of the inner and outer housings, the guide means preferably comprising one or more protrusions on said inner housing which, in use, cooperate with corresponding recesses on an interior surface of said outer housing.

35 Preferably, said needle is biased to be normally wholly inside said housing by means of a spring intermediate the barrel and the outer housing.

6

In one embodiment, the needle is removable from the device, this being of benefit in applications where the device is reusable (for example if a multiple-use cartridge of medicament is utilised).

5

In a further embodiment, said needle, barrel and plunger are removable from said device. It is intended that the device of the present invention could be constructed around a standard needle, barrel and plunger of known 10 type.

Preferably, the injection device further includes a removable needle cover which protects the needle during storage and before use. Advantageously, said needle cover 15 includes means for pulling a protective rubber sheath or the like from said needle when said needle cover is removed from the device. Said pulling means may include a floating rivet intermediate the needle cover and the protective rubber sheath or the like, whereby twisting 20 forces applied to said needle cover are substantially prevented from being transmitted to said rubber sheath or the like.

Preferably, the presence of said needle cover on said 25 device serves as a safety lock, substantially preventing relative forward movement of said outer housing.

In a preferred form, the injection device further comprises a viewing window in said barrel aligned with a 30 viewing window in said outer housing such that said medicament can be viewed by a user prior to an injection taking place. Preferably, in use during an injection, said inner housing moves intermediate said viewing window in the outer housing and said barrel so as to obscure the 35 window in the barrel from the user's view.

7

Preferably, the injection device includes means for emitting an audible and/or physical indication to a user that the injection is complete.

5 Preferred embodiments of the present invention will now be more particularly described, by way of example only, with reference to the accompanying drawings wherein:

10 Figure 1 is a perspective view, partly in section, showing the injection device, in the condition in which it is supplied to a user, apart from the needle cover;

15 Figure 2, drawn to a larger scale, shows detail of part of the device shown in Figure 1;

Figure 3 is a perspective view, partly in section, showing the injection device, during an injection;

20 Figure 4, drawn to a larger scale, shows detail of part of the device shown in Figure 3;

25 Figure 5 is a perspective view, partly in section, showing the injection device, with the plunger fully depressed into the barrel;

Figure 6, drawn to a larger scale, shows detail of part of the device shown in Figure 5;

Figure 7 is a perspective view, partly in section,

## CLAIMS

25

1. An injection device comprising an outer housing (30) adapted to receive:
  - 5 a barrel for holding a volume of a medicament;
  - a needle (10) at one end of the barrel, the needle and barrel being such that at least part of the needle is axially moveable in and out of said outer housing (30) but is biased to be normally wholly inside said housing; and
  - 10 a plunger (8), axially moveable within the barrel,  
wherein the injection device further comprises:
    - 15 an inner housing (7) intermediate the outer housing and the barrel and plunger; and
    - an energy source (1; 40) in communication with said inner housing (7), characterised in that the inner housing (7) is moveable by the energy source between three positions, namely
  - 20 a first position in which the inner housing has one or more radially flexible tags (7B) in communication with the barrel such that, in use, the plunger and barrel are movable axially so as to move at least part of said needle out of the outer housing;
  - 25 a second position in which the inner housing has one or more radially flexible tags (7A) in communication with the plunger but not the barrel such that, in use, said plunger is movable axially into said barrel so as to expel medicament through the needle; and
  - 30 a third position in which said radially flexible tags (7A, 7B) on the inner housing are in communication with neither the plunger nor the barrel such that, in use, the plunger and barrel are able to retract in order to retract the needle into the outer housing.

2. The injection device of claim 1 inside which is located

5 said barrel for holding a volume of a medicament;

said needle (10) at one end of the barrel; and said plunger (8), axially moveable within the barrel.

10 3. An injection device as claimed in claim 1 or claim 2 further comprising a spring housing (41) intermediate the outer housing (30) and the inner housing (7).

15 4. An injection device as claimed in any of the preceding claims wherein one or more of said tags is located at the end of a resiliently flexible leg.

20 5. An injection device as claimed in any of the preceding claims wherein one or more of said tags are situated at the rear end of the inner housing and are moveable radially into and out of communication with the plunger.

25 6. An injection device as claimed in any of claims 3-5 wherein said tags are biased radially inwardly into communication with said plunger, preferably by communication with said spring housing.

30 7. An injection device as claimed in any of the preceding claims wherein said tags are stored in their relaxed condition, before initiating an injection.

35 8. An injection device as claimed in any of claims 3-7 wherein each rear tag is moveable out of communication with the plunger when aligned with a

27  
corresponding recess in the spring housing.

9. An injection device as claimed in any of the preceding claims wherein each rear tag is substantially 5 T-shaped.

10. An injection device as claimed in any of claims 1-4 wherein one or more of said tags are situated at the forward end of the inner housing and are moveable 10 radially into and out of communication with the barrel.

11. An injection device as claimed in claim 10 wherein said forward tags are biased radially inwardly 15 into communication with said barrel, preferably by communication with said spring housing.

12. An injection device as claimed in claim 10 or 20 claim 11 wherein said forward tags are stored in their relaxed condition, before initiating an injection.

13. An injection device as claimed in any of claims 10-12 wherein each forward tag is moveable out of communication with the barrel when aligned with a 25 corresponding recess in the spring housing.

14. An injection device as claimed in any of claims 10-13 wherein each forward tag is substantially L-shaped.

30 15. An injection device as claimed in any of the preceding claims wherein said energy source is a compressed gas.

16. An injection device as claimed in any of claims 35 1-14 wherein said energy source is a spring.

28  
17. An injection device as claimed in any of the preceding claims further including means for allowing the inner housing to move axially only forward with respect to the outer housing.

5

18. An injection device as claimed in claim 17 wherein said means is an arrangement of serrations, barbs, ratchet teeth or the like intermediate the housings.

10

19. An injection device as claimed in any of the preceding claims further comprising guide means for guiding, in use, the relative axial movement of the spring and outer housings, the guide means preferably comprising one or more protrusions on said spring housing which, in use, cooperate with corresponding recesses on an interior surface of said outer housing.

15

20. An injection device as claimed in any of the preceding claims wherein said needle is biased to be normally wholly inside said housing by means of a spring intermediate the barrel and the outer and/or spring housing.

25

21. An injection device as claimed in any of the preceding claims wherein the needle is removable from said device.

30

22. An injection device as claimed in any of the preceding claims wherein said needle, barrel and plunger are removable from said device.

35

23. An injection device as claimed in any of the preceding claims further including a removable needle cover which protects the needle during storage before use.

24. An injection device as claimed in claim 23 wherein said needle cover includes means for pulling a protective rubber sheath or the like from said needle when said needle cover is removed from the device.

5

25. An injection device as claimed in claim 24 wherein said pulling means includes a floating rivet intermediate the needle cover and the protective rubber sheath or the like, whereby twisting forces applied to said needle cover are substantially prevented from being transmitted to said rubber sheath or the like.

10

26. An injection device as claimed in any of claims 23-25 wherein the presence of said needle cover on said device serves as a safety lock, substantially preventing relative forward movement of said outer housing.

15

20 27. An injection device as claimed in any of the preceding claims further comprising a viewing window in said barrel aligned with a viewing window in said outer housing such that said medicament can be viewed by a user prior to an injection taking place.

25

28. An injection device as claimed in claim 27 wherein, in use during an injection, said inner housing moves intermediate said viewing window in the outer housing and said barrel so as to obscure the window in the barrel from the user's view.

30

35 29. An injection device as claimed in any of the preceding claims further comprising means for emitting an audible and/or physical indication to a user that the injection is complete.

Application No. 05 701 985.3 - 2310	Ref. P103497EP	Date 30.10.2006
Applicant The Medical House Plc		

**Communication pursuant to Article 96(2) EPC**

The examination of the above-identified application has revealed that it does not meet the requirements of the European Patent Convention for the reasons enclosed herewith. If the deficiencies indicated are not rectified the application may be refused pursuant to Article 97(1) EPC.

You are invited to file your observations and insofar as the deficiencies are such as to be rectifiable, to correct the indicated deficiencies within a period

of 4 months

from the notification of this communication, this period being computed in accordance with Rules 78(2) and 83(2) and (4) EPC.

One set of amendments to the description, claims and drawings is to be filed within the said period on separate sheets (Rule 36(1) EPC).

**Failure to comply with this invitation in due time will result in the application being deemed to be withdrawn (Article 96(3) EPC).**

Reinbold, Sylvie  
Primary Examiner

Enclosure(s): 3 page/s reasons (Form 2906)

Bescheid/Protokoll (Anlage)	Communication/Minutes (Annex)	Notification/Procès-verbal (Annexe)
Datum Date Date 30.10.2006	Blatt Sheet Feuille 1	Anmelde-Nr.: Application No.: 05 701 985.3 Demande n°:

The examination is being carried out on the **following application documents**:

**Description, Pages**

1, 3-26 as published  
2, 2a filed with entry into the regional phase before the EPO

**Claims, Numbers**

1-29, 30(part) as published  
30(part), 31 filed with entry into the regional phase before the EPO

**Drawings, Sheets**

1/27-27/27 as published

1. The following documents (D) are referred to in this communication; the numbering will be adhered to in the rest of the procedure:  
D1: US-B1-6 544 234  
D2: WO 03/097133  
D3: US-A-5 681 291  
D4: WO 00/09186

**Clarity Article 84 EPC**

2. Although **claims 1,29 and 30** have been drafted as separate **independent claims**, they appear to relate effectively to the same subject-matter and to differ from each other only with regard to the definition of the subject-matter and in respect of the terminology used for the features of that subject-matter. The aforementioned claims therefore lack consistencies.  
Moreover, lack of clarity of the claims as a whole arises, since the plurality of independent claims makes it difficult, if not impossible, to determine the matter for which protection is sought, and places an undue burden on others seeking to establish the extent of the protection. (Article 84 EPC)  
Furthermore, the present set of claims does not meet the requirements of Rule 29(2)

Bescheid/Protokoll (Anlage)	Communication/Minutes (Annex)	Notification/Procès-verbal (Annexe)
Datum Date Date 30.10.2006	Blatt Sheet Feuille 2	Anmelde-Nr.: Application No.: 05 701 985.3 Demande n°:

EPC.

Failing to provide a single independent claim with the next letter of reply will result in a refusal of the application according to Article 97(1) EPC.

### Further comments

3. The features of the claims should be provided with **reference signs** placed in parentheses to increase the intelligibility of the claims (Rule 29(7) EPC). This applies to both the preamble and characterising portion (see the Guidelines, C-III, 4.11).
4. Independent claim 1 is not in the **two-part form** in accordance with Rule 29(1) EPC, which in the present case would be appropriate, with those features known in combination from the prior art (document D1) being placed in the preamble (Rule 29(1)(a) EPC) and with the remaining features being included in the characterising part (Rule 29(1)(b) EPC).
5. To meet the requirements of Rule 27(1)(b) EPC, the **documents D1-D2** should be identified in the **description** and the relevant background art disclosed therein should be briefly discussed.
6. The technical feature of the inner housing is moveable between three positions, namely:
  - a second position in which the inner housing has one or more radially flexible tags which are in communication with the plunger but not the barrel
  - a third position in which said one or more radially flexible tags on the inner housing are in communication with neither the barrel nor the barrel

seems to be inventive.

In order to be able to assess the question of the inventive step, the applicant is asked to indicate in the response which technical problem is solved by the characterising features of the new claim 1 compared to the closest prior art (Rule 27(1)c).
7. When filing amended claims the applicant should at the same time bring the description into conformity with the amended claims. (Rule 27(2) EPC) Care should be taken during revision, especially of the introductory portion and any statements of problem or

**Notification of European publication number and information on the application of Article 67(3) EPC**

The provisional protection under Article 67(1) and (2) EPC in the individual contracting states becomes effective only when the conditions referred to in Article 67(3) EPC have been fulfilled (for further details, see information brochure of the European Patent Office "National Law relating to the EPC" and additional information in the Official Journal of the European Patent Office).

A request has been made for extension of the patent to: AL HR LV MK  
See Official Journal 1-2/1994 for further information on provisional protection.

Pursuant to Article 158(1) EPC the publication under Article 21 PCT of an international application for which the European Patent Office is a designated Office takes the place of the publication of a European patent application.

The bibliographic data of the above-mentioned Euro-PCT application will be published on 02.11.06 in Section I.1 of the European Patent Bulletin. The European publication number is 1715903.

In all future communications to the European Patent Office, please quote the application number plus Directorate number.

Applicant/Proprietor The Medical House Plc	

**Communication pursuant to Rules 109 and 110 EPC**

**(1) Amendment of application documents, especially the claims (R. 109 EPC)**

The above mentioned international (Euro-PCT) application has entered the European phase, or can do so, once the necessary conditions are fulfilled.

Under Articles 28, 41 PCT, Rules 52, 78 PCT and Rule 86(2) to (4) EPC, the applicant may amend the application documents after receiving the international search report.

**Whether or not he has already done so, he now has a further opportunity to file amended claims or other application documents within a non-extendable time limit of one month after notification of the present communication (R. 109 EPC).**

The claims applicable on expiry of the above time limit, i.e. those filed on entry into the European phase or in response to the present communication, will form the basis for the calculation of any claims fee to be paid (see page 2) and for any supplementary search to be carried out under Article 157(2) EPC (R.109 EPC).

**(2) Claims fees under Rule 110 EPC**

If the application documents on which the European grant procedure is to be based comprise more than ten claims, a claims fee shall be payable for the eleventh and each subsequent claim within the period provided for in Rule 107(1) EPC.

Based on the application documents currently on file, all necessary claims fees have already been paid (or the documents do not comprise more than 10 claims).

All necessary fees will be/have been debited automatically according to the automatic debit order.

The claims fee due for the claims ..... to ..... were not paid within the above-mentioned period.

Any non-paid claims fee, either based on the current set of claims or on any amended claims to be filed pursuant to Rule 109 EPC (see page 1), may still be validly paid within a non-extendable period of grace of **one month** after notification of this communication.

If a payment is made for only some of the claims, it must be indicated for which claims it is intended. If a claims fee is not paid in due time, the claim concerned is deemed to be abandoned (R. 110(4) EPC).

If claims fees have already been paid, but on expiry of the above-mentioned time limit there is a new set of claims containing fewer fee-incurring claims than previously, the claims fees in excess of those due under Rule 110(2), 2nd sentence, EPC will be refunded (R. 110(3) EPC).

You are reminded that any supplementary search under Article 157(2) EPC will relate only to the last set of claims applicable on expiry of the above time limit AND will be confined to those fee-incurring claims for which fees have been paid in due time.

**The fee for the eleventh and each subsequent claim is EUR 45,00.**

Dear Sirs

**European Patent Application No. 05701985.3**  
**Regional Phase of International Patent Application No PCT/GB2005/000223**  
**Auto Safety Injector**  
**The Medical House plc**

I enclose herewith documents for proceeding with the regional phase of the above PCT patent application in the European Patent Office, designating all available states and extension states.

Replacement pages 2 and 2a of the description are enclosed, on which prior art document D1 has been identified and discussed. Replacement page 33 of the claims is enclosed on which original claim 32 has been deleted. Therefore claims 1-31, as attached to the International Preliminary Report on Patentability are currently pending in the application. The applicant reserves the right to file a divisional application for any of the subject matter contained in the original application as filed.

Also enclosed are copies of EPO Form 1037, and I should be grateful if you would stamp and return one of these to me immediately, as an acknowledgement of receipt of the above documents.

You are authorised to deduct the necessary fees for the filing of this application from our deposit account

25.08.2006

the plunger.

(43)

An alternative way of concealing the needle after an injection has been delivered is described in US6544234 (BD Medico SARL), which discloses an injection device in which the needle is concealed before injection, but the configuration of the device is such that the needle cannot retract after injection. Instead, there is a moveable needle protection sleeve which is displaced by a compression spring when the needle is pulled out of the subcutaneous tissue in order to conceal the needle from the patient.

Although the present invention may relate to mini-needle or jet injection devices, the invention is equally applicable to other types of injection device, for example those for deep-penetrating muscular injection as well as those which are for shallower, subcutaneous, injection.

According to a first aspect of the present invention there is provided an injection device comprising an outer housing inside which is located

- 20 a barrel for holding a volume of a medicament;
- 25 a needle at one end of the barrel, the needle and barrel being such that at least part of the needle is axially moveable in and out of said outer housing but is biased to be normally wholly inside said housing;
- 30 a plunger, axially moveable within the barrel;
- 35 an inner housing intermediate the outer housing and the barrel and plunger; and
- an energy source in communication with said inner housing,
- wherein the inner housing is moveable by the energy source between three positions, namely

25. 08. 2006

(43)

2a

a first position in which the inner housing is in communication with both the plunger and the barrel such that, in use, the plunger and barrel are movable axially so as to move at least part of said needle out of the 5 outer housing;

a second position in which the inner housing is in communication with the plunger but not the barrel such that, in use, said plunger is movable axially into said barrel so as to expel medicament through the needle; and 10 a third position in which the inner housing is in communication with neither the plunger nor the barrel

25. 08. 2006

the plunger.

(43)

5       An alternative way of concealing the needle after an injection has been delivered is described in US6544234 (BD Medico SARL), which discloses an injection device in which the needle is concealed before injection, but the configuration of the device is such that the needle cannot retract after injection. Instead, there is a moveable needle protection sleeve which is displaced by a 10 compression spring when the needle is pulled out of the subcutaneous tissue in order to conceal the needle from the patient.

15       Although the present invention may relate to mini-needle or jet injection devices, the invention is equally applicable to other types of injection device, for example those for deep-penetrating muscular injection as well as those which are for shallower, subcutaneous, injection.

20       According to a first aspect of the present invention there is provided an injection device comprising an outer housing inside which is located  
          a barrel for holding a volume of a medicament;  
25       a needle at one end of the barrel, the needle and barrel being such that at least part of the needle is axially moveable in and out of said outer housing but is biased to be normally wholly inside said housing;  
          a plunger, axially moveable within the barrel;  
30       an inner housing intermediate the outer housing and the barrel and plunger; and  
          an energy source in communication with said inner housing,  
          wherein the inner housing is moveable by the energy 35 | source between three positions, namely

(43)

a plunger, axially moveable within the barrel, wherein the injection device further comprises:

5 an inner housing intermediate the outer housing and the barrel and plunger; and

an energy source in communication with said inner housing,

characterised in that the inner housing is moveable by the energy source between three positions, namely

10 a first position in which the inner housing has one or more radially flexible tags in communication with the barrel such that, in use, the plunger and barrel are movable axially so as to move at least part of said needle out of the outer housing;

15 a second position in which the inner housing has one or more radially flexible tags in communication with the plunger but not the barrel such that, in use, said plunger is movable axially into said barrel so as to expel medicament through the needle; and

20 a third position in which said radially flexible tags on the inner housing are in communication with neither the plunger nor the barrel such that, in use, the plunger and barrel are able to retract in order to retract the needle into the outer housing.

25

31. An injection device as claimed in claim 29 or claim 30 having all of the features of any of claims 2-28.

a plunger, axially moveable within the barrel, wherein the injection device further comprises:

5 an inner housing intermediate the outer housing and the barrel and plunger; and

an energy source in communication with said inner housing,

characterised in that the inner housing is moveable by the energy source between three positions, namely

10 a first position in which the inner housing has one or more radially flexible tags in communication with the barrel such that, in use, the plunger and barrel are movable axially so as to move at least part of said needle out of the outer housing;

15 a second position in which the inner housing has one or more radially flexible tags in communication with the plunger but not the barrel such that, in use, said plunger is movable axially into said barrel so as to expel medicament through the needle; and

20 a third position in which said radially flexible tags on the inner housing are in communication with neither the plunger nor the barrel such that, in use, the plunger and barrel are able to retract in order to retract the needle into the outer housing.

25

31. An injection device as claimed in claim 29 or claim 30 having all of the features of any of claims 2-28.

30 32. ~~An injection device substantially as described herein with reference to and as illustrated in any appropriate combination of the accompanying drawings.~~

the plunger.

An alternative way of concealing the needle after an injection has been delivered is described in US6544234 5 (BD Medico SARL), which discloses an injection device in which the needle is concealed before injection, but the configuration of the device is such that the needle cannot retract after injection. Instead, there is a moveable needle protection sleeve which is displaced by a 10 compression spring when the needle is pulled out of the subcutaneous tissue in order to conceal the needle from the patient.

Although the present invention may relate to mini-needle 15 or jet injection devices, the invention is equally applicable to other types of injection device, for example those for deep-penetrating muscular injection as well as those which are for shallower, subcutaneous, injection.

20 According to a first aspect of the present invention there is provided an injection device comprising an outer housing inside which is located

25 a barrel for holding a volume of a medicament; a needle at one end of the barrel, the needle and barrel being such that at least part of the needle is axially moveable in and out of said outer housing but is biased to be normally wholly inside said housing;

30 a plunger, axially moveable within the barrel; an inner housing intermediate the outer housing and the barrel and plunger; and

35 an energy source in communication with said inner housing, wherein the inner housing is moveable by the energy source between three positions, namely

2a

a first position in which the inner housing is in communication with both the plunger and the barrel such that, in use, the plunger and barrel are movable axially so as to move at least part of said needle out of the 5 outer housing;

a second position in which the inner housing is in communication with the plunger but not the barrel such that, in use, said plunger is movable axially into said barrel so as to expel medicament through the needle; and 10

a third position in which the inner housing is in communication with neither the plunger nor the barrel

a plunger, axially moveable within the barrel,  
wherein the injection device further comprises:  
5                   an inner housing intermediate the outer housing  
                  and the barrel and plunger; and  
                  an energy source in communication with said  
                  inner housing,  
                  characterised in that the inner housing is moveable  
                  by the energy source between three positions, namely  
10                   a first position in which the inner housing has  
                  one or more radially flexible tags in communication with  
                  the barrel such that, in use, the plunger and barrel are  
                  movable axially so as to move at least part of said  
                  needle out of the outer housing;  
15                   a second position in which the inner housing  
                  has one or more radially flexible tags in communication  
                  with the plunger but not the barrel such that, in use,  
                  said plunger is movable axially into said barrel so as to  
                  expel medicament through the needle; and  
20                   a third position in which said radially  
                  flexible tags on the inner housing are in communication  
                  with neither the plunger nor the barrel such that, in  
                  use, the plunger and barrel are able to retract in order  
                  to retract the needle into the outer housing.  
25                   31. An injection device as claimed in claim 29 or claim  
                  30 having all of the features of any of claims 2-28.

the plunger.

5        An alternative way of concealing the needle after an injection has been delivered is described in US6544234 (BD Medico SARL), which discloses an injection device in which the needle is concealed before injection, but the configuration of the device is such that the needle cannot retract after injection. Instead, there is a moveable needle protection sleeve which is displaced by a compression spring when the needle is pulled out of the 10 subcutaneous tissue in order to conceal the needle from the patient.

15        Although the present invention may relate to mini-needle or jet injection devices, the invention is equally applicable to other types of injection device, for example those for deep-penetrating muscular injection as well as those which are for shallower, subcutaneous, 20 injection.

25        According to a first aspect of the present invention there is provided an injection device comprising an outer housing inside which is located

      a barrel for holding a volume of a medicament;

30        a needle at one end of the barrel, the needle and barrel being such that at least part of the needle is axially moveable in and out of said outer housing but is biased to be normally wholly inside said housing;

      a plunger, axially moveable within the barrel;

35        an inner housing intermediate the outer housing and the barrel and plunger; and

      an energy source in communication with said inner housing,

      wherein the inner housing is moveable by the energy 35 | source between three positions, namely

a plunger, axially moveable within the barrel, wherein the injection device further comprises:

5 an inner housing intermediate the outer housing and the barrel and plunger; and

an energy source in communication with said inner housing,

characterised in that the inner housing is moveable by the energy source between three positions, namely

10 a first position in which the inner housing has one or more radially flexible tags in communication with the barrel such that, in use, the plunger and barrel are movable axially so as to move at least part of said needle out of the outer housing;

15 a second position in which the inner housing has one or more radially flexible tags in communication with the plunger but not the barrel such that, in use, said plunger is movable axially into said barrel so as to expel medicament through the needle; and

20 a third position in which said radially flexible tags on the inner housing are in communication with neither the plunger nor the barrel such that, in use, the plunger and barrel are able to retract in order to retract the needle into the outer housing.

25 31. An injection device as claimed in claim 29 or claim 30 having all of the features of any of claims 2-28.

30 ~~32. An injection device substantially as described herein with reference to and as illustrated in any appropriate combination of the accompanying drawings.~~
